This manual contains instructions for SAFETY, OPERATION, and MAINTENANCE/SERVICE for the MacDon M105 Self-Propelled Windrower.

California Proposition 65 Warning

Diesel engine exhaust and some of its constituents are known to the State of California to cause cancer, birth defects, and other reproductive harm. Battery posts, terminals, and related accessories contain lead and lead components. Wash hands after handling.
Declaration of Conformity

EC Declaration of Conformity

MacDon Industries Ltd
680 Moray Street
Winnipeg, Manitoba, Canada R3J 3S3

The undersigned hereby declares that:

Machine type: M Series Windrower
Model: M105, M155, M205
Serial Number(s): As Per Shipping Document

fulfills all relevant provisions and essential requirements of the following directives:

<table>
<thead>
<tr>
<th>Directive</th>
<th>Number</th>
<th>Certification Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Machinery Directive</td>
<td>2006/42/EC</td>
<td>Self-Certification</td>
</tr>
</tbody>
</table>

Name and address of the person in the European Community authorized to compile the technical construction file:

Johannes Molitor
Schwarzwald Strasse 67
66482 Zweibrucken / Germany
HRB 31002, Amtsgericht Zweibrucken

Place of Declaration: Winnipeg, Manitoba, Canada
Date of Declaration: 01 July 2013

Name: Ibrahim Saleh
Title: Director, Product Integrity

Figure 1: Declaration of Conformity
Continued on next page.
Whole Body and Hand-Arm Vibration Levels

The weighted root mean square acceleration, to which the whole body is subjected, ranges from 0.57 to 1.06 m/s² as measured on a representative machine during typical operations and analyzed in accordance with ISO 5008. During the same operations, the weighted root means square hand-arm vibration was less than 1.45 m/s² when analyzed in accordance with ISO 5349. These acceleration values depend on the roughness of the ground, the speeds at which the windrower is operated, the operator’s experience, weight, and driving habits.

Noise Levels

The A-weighted sound pressure levels inside the operator’s station ranged from 70.1 to 73.1 dB(A) as measured on several representative machines in accordance with ISO 5131. The sound pressure level depends upon the engine speed and load, field and crop conditions, and the type of platform used.
Introduction

This manual contains information on the MacDon M105 Self-Propelled Windrower, which is designed to cut and lay in windrows a wide variety of grain, hay, and specialty crops. Windrowing allows starting the harvest earlier, protects the crop from wind damage, and gives you more flexibility in scheduling combine time.

The power unit (referred to in this manual as the “windrower”), when coupled with one of the specially designed auger or draper headers, provides a package which incorporates many features and improvements in design.

Use this manual as your first source of information about the machine. Use the Table of Contents and the Index to guide you to specific areas. Study the Table of Contents to familiarize yourself with how the material is organized.

If you follow the instructions given here, your M105 Windrower will work well for many years.

Use this manual in conjunction with your header operator's manual.

A manual storage case is provided in the cab. Keep this manual handy for frequent reference and to pass on to new Operators or Owners. Call your Dealer if you need assistance, information, or additional copies of this manual.

CAREFULLY READ ALL THE MATERIAL PROVIDED BEFORE ATTEMPTING TO USE THE MACHINE.

NOTE: Keep your MacDon publications up-to-date. The most current version can be downloaded from our website www.macdon.com or from our Dealer-only site (https://portal.macdon.com) (login required).
List of Revisions

At MacDon, we are continuously making improvements: occasionally these improvements impact product documentation. The following list provides an account of major changes from the previous version of this document.

<table>
<thead>
<tr>
<th>Summary of Change</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Added new safety sign locations.</td>
<td>1.11 Safety Sign Locations, page 13</td>

Serial Number

If you require MacDon® technical assistance, please have the serial number recorded and ready, before you call. Record the model number, model year, and serial number of the windrower and engine on the lines below.

The windrower serial number plate (A) is located on the left side of the main frame near the walking beam.

<table>

1 Safety

1.1 Safety Alert Symbols

This safety alert symbol indicates important safety messages in this manual and on safety signs on the windrower.

This symbol means:

• ATTENTION!
• BECOME ALERT!
• YOUR SAFETY IS INVOLVED!

Carefully read and follow the safety message accompanying this symbol.

Why is safety important to you?

• Accidents disable and kill.
• Accidents cost.
• Accidents can be avoided.

Figure 1.1: Safety Symbol
1.2 Signal Words

Three signal words, DANGER, WARNING, and CAUTION, are used to alert you to hazardous situations. The appropriate signal word for each situation has been selected using the following guidelines:

⚠️ DANGER

Indicates an imminently hazardous situation that, if not avoided, will result in death, or serious injury.

⚠️ WARNING

Indicates a potentially hazardous situation that, if not avoided, could result in death, or serious injury. It may also be used to alert against unsafe practices.

⚠️ CAUTION

Indicates a potentially hazardous situation that, if not avoided, may result in minor, or moderate injury. It may be used to alert against unsafe practices.
1.3 General Safety

**CAUTION**

The following are general farm safety precautions that should be part of your operating procedure for all types of machinery.

Protect yourself

- When assembling, operating, and servicing machinery, wear all the protective clothing and personal safety devices that **COULD** be necessary for the job at hand. Don’t take chances.

- You may need:
  - A hard hat
  - Protective footwear with slip resistant soles
  - Protective glasses or goggles
  - Heavy gloves
  - Wet weather gear
  - A respirator or filter mask
  - Hearing protection

Be aware that exposure to loud noise can cause impairment or loss of hearing. Wearing suitable hearing protection devices such as ear muffs or ear plugs. These will help protect against objectionable or loud noises.

- Provide a first aid kit for use in case of emergencies.

- Keep a fire extinguisher on the machine. Be sure the fire extinguisher is properly maintained. Be familiar with its proper use.

- Keep young children away from the machinery at all times.

- Be aware that accidents often happen when the Operator is tired or in a hurry to get finished. Take the time to consider the safest way. Never ignore warning signs of fatigue.
SAFETY

• Wear close fitting clothing and cover long hair. Never wear dangling items such as scarves or bracelets.

• Keep all shields in place. Never alter or remove safety equipment. Make sure driveline guards can rotate independently of the shaft and can telescope freely.

• Use only service and repair parts, made, or approved by the equipment manufacturer. Substituted parts may not meet strength, design, or safety requirements.

• Keep hands, feet, clothing, and hair away from moving parts. Never attempt to clear obstructions or objects, from a machine while the engine is running.

• Do NOT modify the machine. Non-authorized modifications may impair machine function and/or safety. It may also shorten the machine’s life.

• Stop the engine and remove the key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

• Keep the area used for servicing machinery clean and dry. Wet or oily floors are slippery. Wet spots can be dangerous when working with electrical equipment. Be sure all electrical outlets and tools are properly grounded.

• Keep work area well lit.

• Keep machinery clean. Straw and chaff, on a hot engine, are a fire hazard. Do NOT allow oil or grease to accumulate on service platforms, ladders, or controls. Clean machines before storage.

• Never use gasoline, naphtha, or any volatile material for cleaning purposes. These materials may be toxic and/or flammable.

• When storing machinery, cover sharp or extending components to prevent injury from accidental contact.

Figure 1.5: Safety around Equipment

Figure 1.6: Safety around Equipment

Figure 1.7: Safety around Equipment
1.4 Maintenance Safety

To ensure your safety while maintaining the machine:

- Review the operator’s manual and all safety items before operation and/or maintenance of the machine.

- Place all controls in Neutral, stop the engine, set the park brake, remove the ignition key, and wait for all moving parts to stop before servicing, adjusting, and/or repairing.

- Follow good shop practices:
  - Keep service area clean and dry.
  - Be sure electrical outlets and tools are properly grounded.
  - Use adequate light for the job at hand.

- Relieve pressure from hydraulic circuits before servicing and/or disconnecting the machine.

- Before applying pressure to a hydraulic system, make sure all components are tight and that steel lines, hoses, and couplings are in good condition.

- Keep hands, feet, clothing, and hair away from all moving and/or rotating parts.

- Clear the area of bystanders especially children when carrying out any maintenance and repairs or when making any adjustments.

- Install transport lock or place safety stands under the frame before working under the windrower.

- If more than one person is servicing the machine at the same time, be aware that rotating a driveline or other mechanically driven component by hand (for example, accessing a lube fitting) will cause drive components in other areas (belts, pulleys, and knife) to move. Stay clear of driven components at all times.

- Wear protective gear when working on the machine.

- Wear heavy gloves when working on knife components.
1.5 Hydraulic Safety

• Always place all hydraulic controls in Neutral before dismounting.

• Make sure that all components in the hydraulic system are kept in good condition and clean.

• Replace any worn, cut, abraded, flattened, or crimped hoses and steel lines.

• Do NOT attempt any makeshift repairs to the hydraulic lines, fittings, or hoses by using tapes, clamps, cements, or welding. The hydraulic system operates under extremely high pressure. Such makeshift repairs will fail suddenly and create a hazardous and unsafe condition.

• Wear proper hand and eye protection when searching for a high-pressure hydraulic leak. Use a piece of cardboard as a backstop instead of hands to isolate and identify a leak.

• If injured by a concentrated high-pressure stream of hydraulic fluid, seek medical attention immediately. Serious infection or toxic reaction can develop from hydraulic fluid piercing the skin.

• Before applying pressure to a hydraulic system, make sure all components are tight and that steel lines, hoses, and couplings are in good condition.
1.6 Tire Safety

- Failure to follow proper procedures when mounting a tire on a wheel or rim can produce an explosion that may result in serious injury or death.

- Do NOT attempt to mount a tire unless you have the proper training and equipment.

- Have a qualified tire dealer or repair service perform required tire maintenance.
1.7 Battery Safety

**WARNING**

- Keep all sparks and flames away from the batteries, as a gas given off by electrolyte is explosive.
- Ventilate when charging in enclosed space.

**WARNING**

- Wear safety glasses when working near batteries.
- Do NOT tip batteries more than 45° to avoid electrolyte loss.
- Battery electrolyte causes severe burns. Avoid contact with skin, eyes, or clothing.
- Electrolyte splashed into the eyes is extremely dangerous. Should this occur, force the eye open, and flood with cool, clean water for five minutes. Call a doctor immediately.
- If electrolyte is spilled or splashed on clothing or the body, neutralize it immediately with a solution of baking soda and water, then rinse with clear water.

**WARNING**

- To avoid injury from spark or short circuit, disconnect battery ground cable before servicing and part of electrical system.
- Do NOT operate the engine with alternator or battery disconnected. With battery cables disconnected and engine running, a high voltage can be built up if terminals touch the frame. Anyone touching the frame under these conditions would be severely shocked.
- When working around storage batteries, remember that all of the exposed metal parts are live. Never lay a metal object across the terminals because a spark or short circuit will result.
- Keep batteries out of reach of children.
1.8 Welding Precaution

High currents and voltage spikes associated with welding can cause damage to electronic components. Before welding on any part of the windrower or an attached header, disconnect all electronic module harness connections as well as the battery cables. Refer to your MacDon Dealer for proper procedures.
1.9 Engine Safety

**WARNING**

Do NOT use aerosol types of starting aids such as ether. Such use could result in an explosion and personal injury.

**CAUTION**

- In the initial start-up of a new, serviced, or repaired engine, always make provision to shut the engine off in order to stop an over-speed. This may be accomplished by shutting off the air and/or fuel supply to the engine. Over-speed shut down should occur automatically for engines that are controlled electronically.

- Do NOT bypass or disable the automatic shutoff circuits. The circuits are provided in order to help prevent personal injury. The circuits are also provided in order to help prevent engine damage. Refer to your MacDon Dealer for repairs and adjustments.

- Inspect the engine for potential hazards.

- Before starting the engine, ensure that no one is on, underneath, or close to the engine. Ensure that people clear the area.

- All protective guards and all protective covers must be installed if the engine must be started in order to perform service procedures.

- To help prevent an accident that is caused by parts in rotation, work around the parts carefully.

- If a warning tag is attached to the engine start switch or to the controls, do NOT start the engine or move the controls. Consult with the person who attached the warning tag before the engine is started.

- Start the engine from the operator’s compartment. Always start the engine according to the procedure that is described in the Starting the Engine section of the operator’s manual. Knowing the correct procedure will help to prevent major damage to the engine components and prevent personal injury.

- To ensure that the jacket water heater (if equipped) and/or the lube oil heater (if equipped) is working correctly, check the water temperature gauge and/or the oil temperature gauge during the heater operation. Engine exhaust contains products of combustion which can be harmful to your health. Always start the engine and operate the engine in a well ventilated area. If the engine is started in an enclosed area, vent the engine exhaust to the outside.

**NOTE:**
The engine may be equipped with a device for cold starting. If the engine will be operated in very cold conditions, then an additional cold starting aid may be required. Normally, the engine will be equipped with the correct type of starting aid for your region of operation.

1.9.1 High Pressure Rails

**CAUTION**

Contact with high pressure fuel may cause fluid penetration and burn hazards. High pressure fuel spray may cause a fire hazard. Failure to follow these inspection, maintenance and service instructions may cause personal injury or death.
1.9.2 Engine Electronics

⚠️ WARNING

Tampering with the electronic system installation or the original equipment manufacturer (OEM) wiring installation can be dangerous and could result in personal injury or death and/or engine damage.

⚠️ WARNING

Electrical Shock Hazard. The electronic unit injectors use DC voltage. The engine control module (ECM) sends this voltage to the electronic unit injectors. Do NOT come in contact with the harness connector for the electronic unit injectors while the engine is operating. Failure to follow this instruction could result in personal injury or death.

This engine has a comprehensive, programmable engine monitoring system. The ECM has the ability to monitor the engine operating conditions. If conditions exceed the allowable range, the ECM will initiate an immediate action.

The following actions are available for engine monitoring control:

• Warning
• Derate
• Shutdown

The following monitored engine operating conditions have the ability to limit engine speed and/or the engine power:

• Engine coolant temperature
• Engine oil pressure
• Engine speed
• Intake manifold air temperature

The engine monitoring package can vary for different engine models and different engine applications. However, the monitoring system and the engine monitoring control will be similar for all engines. Together, the two controls provide the engine monitoring function for the specific engine application.
1.10 Safety Signs

- Keep safety signs clean and legible at all times.
- Replace safety signs that are missing or become illegible.
- If original parts on which a safety sign was installed are replaced, be sure the repair part also bears the current safety sign.
- Safety signs are available from your Dealer Parts Department.

1.10.1 Installing Safety Decals

To install a safety decal, follow these steps:

1. Clean and dry the installation area.
2. Decide on the exact location before you remove the decal backing paper.
3. Remove the smaller portion of the split backing paper.
4. Place the sign in position and slowly peel back the remaining paper, smoothing the sign as it is applied.
5. Prick small air pockets with a pin and smooth out.

1.12 Interpreting Safety Signs

In the safety sign explanations below, (a) refers to the top or left position panel, (b) refers to the bottom or right position of the safety decal depending on decal orientation.

NOTE:
If there are more than two panels in a decal, the lettering will continue downward or to the right, depending on decal orientation.

1. MD #166233
   a. Run-over hazard.
   b. DANGER
      • Do not start engine by shorting across starter or starter relay terminals. Machine will start with drive engaged and move if starting circuitry is bypassed.
      • Start engine only from operator’s seat. Do not try to start engine with someone under or near machine.

2. MD #166234
   a. Run-over hazard.
   b. WARNING
      • The training seat is provided for an experienced Operator of the machine when a new Operator is being trained.
      • The training seat is not intended as a passenger seat or for use by children.
      • Use the seat belt whenever operating the machine or riding as a trainer.
      • Keep all other riders off the machine.
3. MD #166438
   a. Crushing hazard.
   b. DANGER
      • Rest header on ground or engage safety props before going under unit.

4. MD #166439
   a. Crushing hazard.
   b. DANGER
      • Rest header on ground or engage safety props before going under unit.
SAFETY

5. MD #166440
   a. Loss of control hazard.
   b. CAUTION
      • To prevent machine damage and/or loss of control, it is essential that the machine be equipped such that weights are within the specified limits.

Figure 1.28: MD #166440

6. MD #166450
   a. Hot surface hazard.
   b. WARNING
      • To avoid injury, keep a safe distance from hot surface.

Figure 1.29: MD #166450

7. MD #166451
   a. Rotating fan hazard.
   b. WARNING
      • To avoid injury, stop the engine and remove the key before opening engine hood.

Figure 1.30: MD #166451
8. MD #166454
   a. General hazard pertaining to machine operation and servicing.
   b. **CAUTION**
      To avoid injury or death from improper or unsafe machine operation:
      i. Read the operator’s manual and follow all safety instructions. If you do not have a manual, obtain one from your dealer.
      ii. Do not allow untrained persons to operate the machine.
      iii. Review safety instructions with all Operators annually.
      iv. Ensure that all safety signs are installed and legible.
      v. Make certain everyone is clear of machine before starting engine and during operation.
      vi. Keep riders off the machine.
      vii. Keep all shields in place and stay clear of moving parts.
      viii. Disengage header drive, put transmission in Neutral, and wait for all movement to stop before leaving operator’s position.
      ix. Shut off the engine and remove the key from ignition before servicing, adjusting, lubricating, cleaning, or unplugging machine.
      x. Engage locks to prevent lowering of header or reel before servicing in the raised position.
      xi. Use slow moving vehicle emblem and flashing warning lights when operating on roadways unless prohibited by law.

9. MD #166455
   a. Explosion hazard.
   b. **WARNING**
      • Prevent serious bodily injury caused by:
      • Explosive battery gases. Keep sparks and flames away from the battery. Refer to operator’s manual for battery boosting and charging procedures.
10. MD #166456
   a. Battery acid hazard.
   b. **WARNING**
      • Corrosive and poisonous battery acid. Acid can severely burn your body and clothing.

Figure 1.33: MD #166456
11. MD #166457
   a. General hazard pertaining to machine operation and servicing.
   b. **CAUTION**
      To avoid injury or death from improper or unsafe machine operation:
      i. Read the operator’s manual and follow all safety instructions. If you do not have a manual, obtain one from your Dealer.
      ii. Do not allow untrained persons to operate the machine.
      iii. Review safety instructions with all Operators annually.
      iv. Ensure that all safety signs are installed and legible.
      v. Make certain everyone is clear of machine before starting engine and during operation.
      vi. Keep riders off the machine.
      vii. Keep all shields in place and stay clear of moving parts.
      viii. Disengage header drive, put transmission in Neutral and wait for all movement to stop before leaving operator’s position.
      ix. Shut off the engine and remove the key from ignition before servicing, adjusting, lubricating, cleaning, or unplugging machine.
      x. Engage locks to prevent lowering of header or reel before servicing in the raised position.
      xi. Use slow moving vehicle emblem and flashing warning lights when operating on roadways unless prohibited by law.
   c. Run-over hazard.
   d. **WARNING**
      • Machine will move if steering wheel is turned while engine is running.
      • Steering response is opposite to what is normally expected when backing up. Turn bottom of steering wheel in direction you want to go.
      • Always move ground speed lever to slow end of range before shifting high-low speed control.
   e. Run-over hazard.
   f. Stop the engine and remove the key from ignition before servicing, adjusting, lubricating, cleaning, or unplugging the machine.
12. MD #166461
   a. Hot fluid under pressure hazard.
   b. **CAUTION**
      - Coolant is under pressure and may be hot. Never remove radiator cap when engine is hot.

13. MD #166462
   a. Collision hazard in transport.
   b. **WARNING**
      - Collision between windrower and other vehicles may result in injury or death.
      
      When driving windrower on public roadways:
      
      i. Obey all highway traffic regulations in your area. Use pilot vehicles front and rear of windrower if required by law.
      
      ii. Use slow moving vehicle emblem and flashing warning lights unless prohibited by law.
      
      iii. If width of attached header impedes other vehicle traffic, remove header and install MacDon approved weight box. Refer to operator’s manual for safe procedure to tow header.

14. MD #166466
   a. High pressure oil hazard.
   b. **WARNING**
      Do not go near leaks.
      
      - High pressure oil easily punctures skin causing serious injury, gangrene, or death.
      
      - If injured, seek emergency medical help. Immediate surgery is required to remove oil.
      
      - Do not use finger or skin to check for leaks.
      
      - Lower load or relieve hydraulic pressure before loosening fittings.
15. MD #174436
   a. High pressure oil hazard.
   b. **WARNING**
      Do not go near leaks.
      • High pressure oil easily punctures skin causing serious injury, gangrene, or death.
      • If injured, seek emergency medical help. Immediate surgery is required to remove oil.
      • Do not use finger or skin to check for leaks.
      • Lower load or relieve hydraulic pressure before loosening fittings.

16. MD #184372
   a. General hazard pertaining to machine operation and servicing.
   b. **CAUTION**
      To avoid injury or death from improper or unsafe machine operation:
      • Read the operator’s manual and follow all safety instructions. If you do not have a manual, obtain one from your Dealer.
      • Do not allow untrained persons to operate the machine.
      • Review safety instructions with all Operators annually.
      • Ensure that all safety signs are installed and legible.
      • Make certain everyone is clear of machine before starting engine and during operation.
      • Keep riders off the machine.
      • Keep all shields in place and stay clear of moving parts.
      • Disengage header drive, put transmission in Neutral, and wait for all movement to stop before leaving operator’s position.
      • Shut off the engine and remove the key from ignition before servicing, adjusting, lubricating, cleaning, or unplugging machine.
      • Engage safety props to prevent lowering of raised unit before servicing in the raised position.
      • Use slow moving vehicle emblem and flashing warning lights when operating on roadways unless prohibited by law.
17. MD #190546
   a. Slippery surface.
   b. **WARNING**
      Do not place foot.
      • Do not use this area as a step or platform.
      • Failure to comply could result in serious injury or death.

Figure 1.40: MD #190546
## 2 Description

### 2.1 Definitions

The following terms and acronyms may be used in this manual.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A-Series header</td>
<td>MacDon auger header.</td>
</tr>
<tr>
<td>API</td>
<td>American Petroleum Institute.</td>
</tr>
<tr>
<td>Bolt</td>
<td>A headed and externally threaded fastener that is designed to be paired with a nut.</td>
</tr>
<tr>
<td>CDM</td>
<td>Cab display module on a self-propelled windrower.</td>
</tr>
<tr>
<td>Center-link</td>
<td>A hydraulic cylinder or manually adjustable turnbuckle type link between the header and the machine to which it is attached. It is used to change header angle.</td>
</tr>
<tr>
<td>CGVW</td>
<td>Combined vehicle gross weight.</td>
</tr>
<tr>
<td>D-Series header</td>
<td>MacDon rigid draper header.</td>
</tr>
<tr>
<td>ECM</td>
<td>Engine control module.</td>
</tr>
<tr>
<td>Finger tight</td>
<td>Finger tight is a reference position where sealing surfaces or components are making contact with each other and the fitting has been tightened to a point where the fitting is no longer loose.</td>
</tr>
<tr>
<td>FFFT</td>
<td>Flats from finger tight.</td>
</tr>
<tr>
<td>GSL</td>
<td>Ground speed lever.</td>
</tr>
<tr>
<td>GVW</td>
<td>Gross vehicle weight.</td>
</tr>
<tr>
<td>Hard joint</td>
<td>A joint made with the use of a fastener where the joining materials are highly incompressible.</td>
</tr>
<tr>
<td>Header</td>
<td>A machine that cuts and lays crop into a windrow and is attached to a self-propelled windrower.</td>
</tr>
<tr>
<td>Hex key</td>
<td>A hex key or Allen key (also known by various other synonyms) is a tool of hexagonal cross-section used to drive bolts and screws that have a hexagonal socket in the head (internal-wrenching hexagon drive).</td>
</tr>
<tr>
<td>hp</td>
<td>Horsepower.</td>
</tr>
<tr>
<td>ISC</td>
<td>Intermediate Speed Control.</td>
</tr>
<tr>
<td>JIC</td>
<td>Joint Industrial Council: a standards body that developed the standard sizing and shape for original 37° flared fitting.</td>
</tr>
<tr>
<td>Knife</td>
<td>A cutting device which uses a reciprocating cutter. Also called a sickle.</td>
</tr>
<tr>
<td>n/a</td>
<td>Not applicable.</td>
</tr>
<tr>
<td>Nut</td>
<td>An internally threaded fastener that is designed to be paired with a bolt.</td>
</tr>
<tr>
<td>N-DETENT</td>
<td>The slot opposite the NEUTRAL position on operator’s console.</td>
</tr>
<tr>
<td>NPT</td>
<td>National Pipe Thread: a style of fitting used for low pressure port openings. Threads on NPT fittings are uniquely tapered for an interference fit.</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>------</td>
<td>------------</td>
</tr>
<tr>
<td>ORB</td>
<td>O-ring boss: a style of fitting commonly used in port opening on manifolds, pumps and motors.</td>
</tr>
<tr>
<td>ORFS</td>
<td>O-ring face seal: a style of fitting commonly used for connecting hoses and tubes. This style of fitting is also commonly called ORS, which stands for O-ring seal.</td>
</tr>
<tr>
<td>PTO</td>
<td>Power Take-Off.</td>
</tr>
<tr>
<td>RoHS (Reduction of Hazardous Substances)</td>
<td>A directive by the European Union to restrict the use of certain hazardous substances (such as hexavalent chromium used in some yellow zinc platings).</td>
</tr>
<tr>
<td>SAE</td>
<td>Society Of Automotive Engineers.</td>
</tr>
<tr>
<td>Screw</td>
<td>A headed and externally threaded fastener that threads into preformed threads or forms its own thread in one of the mating parts.</td>
</tr>
<tr>
<td>Self-Propelled (SP) Windrower</td>
<td>Self-propelled machine consisting of a power unit with a header.</td>
</tr>
<tr>
<td>Soft joint</td>
<td>A joint made with the use of a fastener where the joining materials are compressible or experience relaxation over a period of time.</td>
</tr>
<tr>
<td>spm</td>
<td>Strokes per minute.</td>
</tr>
<tr>
<td>Tractor</td>
<td>Agricultural type tractor.</td>
</tr>
<tr>
<td>Truck</td>
<td>A four-wheel highway/road vehicle weighing no less than 7500 lbs (3400 kg).</td>
</tr>
<tr>
<td>Tension</td>
<td>Axial load placed on a bolt or screw, usually measured in pounds (lb) or Newtons (N).</td>
</tr>
<tr>
<td>TFT</td>
<td>Turns from finger tight.</td>
</tr>
<tr>
<td>Torque</td>
<td>The product of a force X lever arm length, usually measured in foot-pounds (ft-lbf) or Newton-meters (N·m).</td>
</tr>
<tr>
<td>Torque angle</td>
<td>A tightening procedure where the fitting is assembled to a precondition (finger tight) and then the nut is turned further a number of degrees or a number of flats to achieve its final position.</td>
</tr>
<tr>
<td>Torque-tension</td>
<td>The relationship between the assembly torque applied to a piece of hardware and the axial load it induces in the bolt or screw.</td>
</tr>
<tr>
<td>UCA</td>
<td>Upper cross auger.</td>
</tr>
<tr>
<td>Washer</td>
<td>A thin cylinder with a hole or slot located in the center and is to be used as a spacer, load distribution element, or a locking mechanism.</td>
</tr>
<tr>
<td>Windrower</td>
<td>Power unit of a self-propelled header.</td>
</tr>
<tr>
<td>WCM</td>
<td>Windrower control module.</td>
</tr>

3 Operator’s Station

The operator’s station is designed to provide access to windrower controls and operator amenities.

3.1 Operator Console

The console contains controls to operate the windrower, as well as amenities for the Operator.

Figure 3.1: Operator Console

A - Ignition
B - Engine/Windrower Cab Display Module (CDM)
C - Header Controls (GSL, Header Drive Switch, Deck Shift)
D - Ground Speed Controls
E - Throttle
3.2 Operator Presence System

The Operator Presence System is a safety feature designed to deactivate or alarm selected systems when the Operator is not seated at the operator’s station.

These systems include:
- Header Drive
- Engine and Transmission

3.2.1 Header Drive

- Requires the Operator to be seated in the seat in order to engage the header drive.
- Power is maintained to the header drive for five seconds after the Operator leaves the seat, and then the header shuts down.
- After the header has shut down automatically, the HEADER DRIVE switch must be moved to OFF position and back to the ON position again to restart the header.

3.2.2 Engine and Transmission

- The engine will not start when the HEADER DRIVE switch is engaged.
- The engine will not start when the transmission is NOT locked in NEUTRAL.
- The engine will shut down when the windrower is moving at 5 mph (8 km/h) or less and the Operator leaves the seat. The CDM will flash “NO OPERATOR” on the upper line and “ENGINE SHUT DOWN 5...4...3...2...1...0” on the lower line accompanied by a steady tone. At “0”, the engine shuts down.
- If the Operator leaves the seat, and the transmission is NOT locked in NEUTRAL, after two seconds the lower display will flash “NOT IN NEUTRAL”, and an alarm will sound.
3.3 Operator’s Seat Adjustments

The operator’s seat has several adjustments. Refer to the following for the location and description of each adjustment.

A – Armrest Up or Down
- Raise armrest (A) for easier access to the seat.
- Lower armrest (A) after seat belt is buckled.

B – Lumbar Support (Stiffness of Seat Back)
- Rotate knob (B) upward to increase stiffness.
- Rotate knob (B) downward to decrease stiffness.

C – Angle of Armrest
- Rotate knob (C) clockwise to increase armrest angle.
- Rotate knob (C) counterclockwise to decrease angle of the armrest.

D – Angle of Seat Back
- Pull lever (D) up to release the seat back.
- Position seat back as desired.
- Release lever (D) to lock the seat back in position.

E – Seat Fore-Aft Position
- Pull lever (E) up to release the seat for adjustment.
- Move the seat forward or backward as desired.
- Release lever (E) to lock the seat in position.

Figure 3.2: Seat Adjustments
A - Armrest  B - Lumbar Support  C - Armrest Angle  D - Seat Back Angle  E - Seat Fore-Aft Position
3.4 Training Seat (Optional)

A wall-mounted fold-up training seat complete with seat belt is provided.

⚠️ WARNING

- The training seat is provided for an experienced Operator of the machine when a new Operator is being trained.
- The training seat is NOT intended as a PASSENGER SEAT or FOR USE BY CHILDREN. USE THE SEAT BELT whenever operating the machine or riding as a Trainer.
- KEEP ALL OTHER RIDERS OFF THE MACHINE.

For storage, lift seat (B) and secure with latch (A).

To lower seat, lift latch (A) and lower seat (B).
3.5 Seat Belts

The windrower is equipped with a seat belt on the operator’s and trainer’s seats.

⚠️ WARNING

The seat belt can help ensure your safety if it is used and maintained.

- Before starting the engine, securely fasten your seat belt. Ensure that anyone occupying the trainee’s seat is secured by a seat belt as well.
- Never wear a seat belt loosely or with slack in the belt system. Never wear the belt in a twisted condition or pinched between the seat structural members.

To fasten seat belt (A):

1. Pull belt at right side completely across your body.
2. Push the metal eye (B) into the buckle (C) until it locks.
3. Adjust the position of the belt as low on your body as possible.

To release seat belt (A):

4. Push the red button (D) in the end of the buckle.
5. Separate the buckle (C) and metal eye (B).

Figure 3.5: Seat Belt

A - Seat Belt  B - Metal Eye  C - Buckle  D - Red Button
3.6 Steering Column Adjustment

The steering column can be adjusted to suit each particular Operator and for easier entry to and exit from the seat.

To adjust the steering column:
1. Hold onto steering wheel, step on lever (A), and move steering wheel up or down to desired position.
2. Release lever (A) to lock steering wheel position.

Figure 3.6: Adjust Steering Column
3.7 Lighting

The field and road light switches are located on a panel in the cab headliner.

3.7.1 Field Lighting

The following lights are ON/functional when the switch is in the FIELD position:

- field lights (forward)
- flood lights (rear)
- swath lights (rear) (select HIGH / LOW)
- optional HID auxiliary lighting (if installed)
### 3.7.2 Road Lighting

The following lights are ON/functional when the switch is in the ROAD position:

- road lights (front)
- turn signals/hazards (amber) (front)
- turn signals/hazards (amber) (rear)
- red tail lights

**NOTE:**
The hazard lights **MUST** be activated with the switch on the cab display module (CDM) when driving on the road.
3.7.3 Beacon Lighting

MD #B5582

Beacon lighting is an optional feature inside North America but comes standard on windrowers exported outside North America.
The beacon lights are functional when the ignition and the beacon switches are ON.

The amber warning beacons (A) MUST be used when driving on the road where required by law.

3.7.4 Optional HID Auxiliary Lighting (If installed)

Two optional High Intensity Discharge (HID) lights (MD #B5596) provide additional lighting during field operation.

If installed, they are located on the mirror supports, and are activated with the light switch in the FIELD position.
3.8 Windshield Wiper

The ON-OFF windshield wiper control is located in the cab headliner.

![Figure 3.17: Switch in Cab Headliner](image)

![Figure 3.18: Wiper in Park Position](image)
3.9 Rear View Mirrors

Two adjustable outside mounted mirrors (A) provide rear view vision.

The mirror/light assembly is designed to fold backwards if accidentally struck either during normal operation or by another machine. A detent-type lock keeps it in place.

Figure 3.19: Mirrors
3.10 Cab Temperature

The cab environment is controlled by a climate control system that provides clean air-conditioned or heated air for the Operator.

The heater/evaporator/blower assembly is located under the cab floorboard and is accessible from beneath the windrower.

3.10.1 Heater Shut-Off

A shut-off valve (A) at the engine allows the cab heater to be isolated from the engine coolant.

The valve must be OPEN to provide heat to the cab, but for maximum cooling, the valve can be CLOSED.

3.10.2 Air Distribution

Cab air distribution is controlled through adjustable air vents (A) located in the cab posts. The vents provide window and Operator ventilation.
3.10.3 Controls

A – Temperature Control Dial controls cab temperature.
   • Clockwise: Increases temperature.
   • Counterclockwise: Decreases temperature.

B – Blower Switch controls the blower speed.
   • OFF / LOW / MEDIUM / HIGH

C – Air Conditioning Switch controls the A/C system.
   • OFF: A/C does not operate.
   • ON: A/C operates with blower switch ON.

IMPORTANT:
To distribute the refrigerant oil throughout the A/C system, perform the following steps when starting the windrower after more than one week of storage:

1. Ensure heater shut-off valve at engine is OPEN. Refer to 3.10.1 Heater Shut-Off, page 47.
2. Turn blower switch to the first position, turn temperature control switch to MAXIMUM heating, and A/C control to OFF.
3. Start engine and operate at low idle until engine is warm.
4. Click A/C switch from OFF to ON for 1 second, then back to OFF for 5 to 10 seconds. Repeat this step ten times.

3.10.4 Air Conditioning Compressor Protection

The compressor is protected from excessively low and high pressures by two switches that shut down the compressor to prevent damage to the system.

• The LOW PRESSURE switch opens when the pressure falls to 2–8 psi (14–55 kPa), and shuts down the compressor. When the pressure rises to 15–25 psi (103–172 kPa), the switch closes, and allows the compressor to run.

• The HIGH PRESSURE switch opens and stops the compressor when the pressure rises to 315–335 psi (2172–2310 kPa). When the pressure falls to 220–280 psi (1517–1930 kPa), the switch closes and allows the compressor to run.

If the air conditioning system is shut down by either switch, locate the source of the problem, and correct it before operating the system.
3.11 Interior Lights

Two interior lights are installed in the cab headliner.
A low intensity LED light (A) is located directly overhead to provide ambient lighting if desired, and functions only when the ROAD/FIELD light switch is ON. An ON-OFF switch is located on the light.

The other interior light (B) is located on the headliner switch panel, and the push-ON, push-OFF button is located on the light.
3.12 Operator Amenities

The operator’s station includes the following amenities:

**Operator’s Console**
A - Cigarette Lighter  
B - Ashtray/Cupholders  
C - Utility Tray  
D - Auxiliary Power  
E - Data Link Receptacle  
F - Live/Switchable/Ground - 20 A  
G - Manual Storage Case

---

Figure 3.25: Operator Amenities
3.13 Radio

A radio is available as optional equipment from your Dealer.

3.13.1 AM/FM Radio

A space (B) is provided in the cab headliner to accommodate the installation of an AM/FM radio that is available as optional equipment from your Dealer.

Two pre-wired speakers (A) have been factory-installed in the headliner.

For radio installation procedures, refer to M105 Self-Propelled Windrower Unloading and Assembly Instructions for North America (MD #169893)\(^4\) or M-Series Self-Propelled Windrower Unloading and Assembly Instructions for Container Shipments (MD #169886)\(^4\).

Operating instructions are supplied with the radio.

![Figure 3.26: Radio and Speakers](image)

**Figure 3.26: Radio and Speakers**

A - Speakers  
B - Radio Mounting Location

3.13.2 Antenna Mounting

A roof-mounted antenna base for installing a magnetic antenna is available as an option from your Dealer.

Order antenna mount MD #160288, or refer to **3.28: Template for Antenna Mount, page 52** for dimensions.

**IMPORTANT:**

Antenna base can only be installed on the left- and right-hand rear cab roof bolts.

It accommodates most CB, satellite, and two-way radio antennas. Refer to M105 Self-Propelled Windrower Unloading and Assembly Instruction for North America (MD #169893) for installation procedures\(^5\).

![Figure 3.27: Antenna Mount](image)

**Figure 3.27: Antenna Mount**

---

To make your own mount, refer to dimensions template. Use 11 GA. or 3.0 mm steel sheet.

Figure 3.28: Template for Antenna Mount
3.14 **Horn**

The horn is activated by pushing button (A) located beside the ignition key.

Sound the horn three times prior to starting the engine.

The horn (A) is located outside the cab on the rear right-hand corner of the cab, under the roof.
3.15 Engine Controls and Gauges

All engine controls are conveniently located on the operator’s console.

Refer to the illustration for the location and the following for a description of each.

**A – Ignition Switch**
- ACC: Fully counterclockwise
- OFF: All electrical systems OFF
- RUN: Clockwise
- START: Fully clockwise to crank engine. Release and switch returns to RUN
- REMOVE KEY WHEN WINDROWER NOT IN USE. KEY ALSO LOCKS DOORS

**B – Throttle** controls engine speed.
- FULL: Push lever forward
- OPERATING: Refer to 4.3.6 Windrower Operation, page 94
- CLOSED: Pull lever back
3.16 Windrower Controls

Console Controls:

A – TURN SIGNALS activate turn signals on windrower and header.

• Push-ON / Push-OFF

B – GROUND SPEED LEVER (GSL) controls speed and direction of movement.

• F: Forward
• N: NEUTRAL
• N-DETENT: Engages Neutral Interlock, and applies park brake when steering locked in center
• R: Reverse

C – HAZARD WARNING LIGHTS activate signals on windrower and header.

• Push-ON / Push-OFF

E – N-Detent

F – Horn

Autosteer Control:

A – AUTOSTEER ENGAGEMENT SWITCH engages/disengages the automated steering -system (if compatible system is installed).

• ENGAGE: Click to engage
• DISENGAGE: Turn steering wheel or click to disengage
3.17 Header Controls

All header controls are conveniently located on the operator’s console and on the ground speed lever (GSL) handle.

NOTE:
Some controls are optional equipment and may not be present in your unit. Some controls may be installed, but will be nonfunctional for certain headers.

Refer to specific header sections in this manual for detailed operating procedures of all header controls.

3.17.1 Header Drive Switch

The header drive switch (A) engages and disengages the header drive.

To engage the header drive, push the switch to center and pull up.

To disengage the header drive, push the switch down.

IMPORTANT:
Always move throttle lever back to IDLE before engaging header drive. Do NOT engage header with engine at full rpm.

3.17.2 Deck Shift Switch—Draper Header Option

The deck shift switch selects the crop delivery options when the windrower is attached to a draper header equipped with deck shift. The three crop delivery options include:

- Right side delivery (A)
- Center delivery (B)
- Left side delivery (C)
3.17.3 Ground Speed Lever (GSL) Header Switches

The GSL (A) contains switches for the header functions that are most often adjusted while in operation to suit changing crop conditions. All are momentary-type switches.

NOTE:
A decal (B) identifying switch functions is located on the cab post above the operator’s console.
**Display Selector Switch**

The display selector switch (A) selects and displays the settings in the cab display module (CDM) top line read-out (A) for each of the header controls.

Press switch (B) to scroll through settings.

![Figure 3.38: GSL](image)

**Reel Position Switches**

**NOTE:**
Reel position switches work on draper headers only.

To move reel, press and hold the switch at the location shown. Release switch at desired position.

![Figure 3.39: Ground Speed Lever](image)

**Figure 3.39: Ground Speed Lever**

- A - Reel Down
- B - Reel Forward
- C - Reel Up
- D - Reel Aft
Header Position Switches

Press and hold switch at location shown to move header up or down and to change the angle of the header relative to the ground. Release switch at desired position.

NOTE:
Refer to the section in this manual that is specific to your header for detailed switch operating modes.

Reel Speed Switches

Press and hold switch (A) to increase the reel speed. Press and hold switch (B) to decrease the reel speed. Release switch at desired speed.

NOTE:
Auger speed is adjusted proportionately when reel speed is changed.

For further details, refer to 4.6.6 Reel Speed, page 169 for D-Series headers or 4.7.2 Reel Speed, page 181 for A-Series headers.
3.18 Cab Display Module (CDM)

3.18.1 Engine and Windrower Functions

Figure 3.42: CDM Engine and Windrower Functions

A – Engine rpm.
B – Ground Speed: mph or kph.
C – DISPLAY: Engine/windrower functions.
D – HAZARD WARNING LIGHTS switch: Activates hazard warning lights, cancels turn signal.
E – SELECT switch: Allows operator to select display item on lower line. Push to SELECT.
F – TURN SIGNAL switches: Activates turn signals on windrower and header Push-ON / Push-OFF.
3.18.2 Header Functions

Figure 3.43: Cab Display Module

A - Display  B - Select Switch  C - Reel/Auger Speed Controls (Auger Header)
D - Draper Speed Control (Draper Header)  E - Header Index Switch (Options Required)  F - Return to Cut Height Switch

- **DISPLAY**: Header functions
- **SELECT SWITCH**: Allows Operator to select display item on lower line. Push to SELECT.
- **REEL/AUGER SPEED CONTROLS**: AUGER HEADER controls auger and reel speed.
- **DRAPER SPEED CONTROL**: DRAPER HEADER controls draper speed. Push UPPER switch to increase draper speed. Push LOWER switch to decrease draper speed. With optional expansion module, controls Draper Speed INDEX with INDEX SWITCH ON, and controls Draper Speed with INDEX SWITCH OFF.
- **HEADER INDEX SWITCH**: Links Reel and Conveyor Speed to Ground Speed. Push-ON / Push-OFF. Illuminates in ON position.

**NOTE:**
Expansion module (MD# B4666) required for header index feature.

**NOTE:**
Header must be engaged.

- **RETURN TO CUT HEIGHT SWITCH**: Allows cutting height preset. Push-ON / Push-OFF. Illuminates in ON position.

**NOTE:**
Header must be engaged.
3.18.3 Operating Screens

The cab display module (CDM) and the windrower control module (WCM) provide information on several functions for the engine, header, and windrower. The information displayed in various operating modes is described in the following sections.

**Ignition ON, Engine Not Running**

<table>
<thead>
<tr>
<th>Display (upper line) (2–3 seconds)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HEADER DISENGAGED</td>
<td>Indicates HEADER DRIVE switch is OFF. OK to start.</td>
</tr>
</tbody>
</table>

**Engine Running – At Initial Start Up**

<table>
<thead>
<tr>
<th>Display (upper line) (2–3 seconds)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HEADER TYPE AND SIZE</td>
<td>Ignition start, engine running.</td>
</tr>
<tr>
<td>IN PARK</td>
<td>Indicates ground speed lever (GSL) in N-DETENT. On startup.</td>
</tr>
</tbody>
</table>
OPERATOR’S STATION

Engine Running, Header Disengaged

Scroll through display with cab display module (CDM) switch or ground speed lever (GSL) switch.

<table>
<thead>
<tr>
<th>Display (lower or upper line)</th>
<th>Description</th>

</tbody>
</table>
3.18.4 Cab Display Module (CDM) Warning/Alarms

The CDM displays warnings and sounds alarms to notify of abnormal windrower status at startup when the ignition is turned ON, and at engine operating speeds above 500 rpm.

Engine Warning Lights

Figure 3.45: CDM Engine Warning Lights

- ENGINE PRE-HEAT: Illuminates yellow. Wait to start engine.
- WATER IN FUEL: Illuminates yellow. Service recommended.
- CAUTION: Illuminates yellow. Prompt attention is required. Refer to display code.
- STOP: Illuminates red. Stop engine immediately. Refer to display code.
- DISPLAY: Displays malfunction code. Refer to 8 Engine Error Codes, page 341 or Dealer.
Display Warnings and Alarms

Informs Operator of abnormal windrower conditions.

</table>
3.18.5 Cab Display Module (CDM) Programming

Figure 3.47: CDM

A - Side Display  B - Main Display  C - Select Switch
D - Menu Item Scroll Forward  E - Menu Item Scroll Backward  F - Program Switch

SIDE DISPLAY: displays software revision status.
- Upper Line – C### (CDM)
- Lower Line – M### (WCM)

MAIN DISPLAY displays menu item and selection.
- Upper Line – Menu Item
- Lower Line – Selection

SELECT SWITCH places monitor into Program Mode with PROGRAM switch. Press to accept menu item and advance to next item.

MENU ITEM SCROLL FORWARD displays value under menu item.
- Push to scroll forward
- Hold down for fast scroll\(^{10}\)

MENU ITEM SCROLL BACKWARD displays value under menu item.
- Push to scroll backward
- Hold down for fast scroll\(^{10}\)

PROGRAM SWITCH places monitor into program mode. Press while pressing SELECT switch.

\(^{10}\) Fast scroll applies only when changing KNIFE SPEED, OVERLOAD PRESSURE, and TIRE SIZE.
NOTE:
Contact your MacDon Dealer for information regarding software updates to the electronic modules. Your Dealer will have the necessary interface tools and access to the latest software upgrades.

Proceed as follows to program the CDM:

IMPORTANT:
Header must be attached to the windrower so that the CDM can detect the type of header (Header ID) and adjust the programming mode accordingly.

NOTE:
Pressing PROGRAM at any time will cancel the programming mode/menus and return back to the main operating displays. For detailed programming menu selection, refer to Detailed Programming Menu Flow Chart, page 72.

1. Turn ignition key to RUN or start the engine.
2. On CDM, press PROGRAM and SELECT to enter programming mode.
3. Press SELECT. WINDROWER SETUP? with header width displayed on upper line.
4. Press left or right arrow to change value on lower line.
5. Press SELECT to advance to the next L1 item and press arrow keys to change values.
6. Set the following functions:

   NOTE:
The following can be set by the Dealer provided that the header is installed and other information needed is available.
   - TILT CYL INSTALLED?
   - DISC BLK INSTALLED?
   - HDR CUT WIDT?
   - HAY CONDITIONER?
   - SET TIRE SIZE?
7. Press PROGRAM to exit programming mode when finished entering values.

Programming Guidelines

Use the following guidelines when programming the cab display module (CDM):

1. The monitoring system requires programming for each header, and the HEADER MUST BE ATTACHED TO THE WINDROWER so that the CDM recognizes the type of header.
2. Programming the system may be accomplished with or without the engine running.
   - If the engine is running, the transmission must be in Neutral (GSL in N-DETENT).
   - If the engine is not running, the ignition must be turned to RUN.
3. The system only needs to be programmed once for each header. Most functions are preset at the factory but the Operator can make changes later on to suit windrowing conditions or modifications to the machine.
4. Input values for the windrower are provided in this manual, and values for the header functions are in the operator’s manual for the applicable header.
5. The CDM must be in programming mode to view the program menus. Press PROGRAM and SELECT on the CDM to enter programming mode. Exit programming mode at any time by pressing PROGRAM or by turning ignition to OFF.

6. Refer to the Detailed Programming Menu Flow Chart, page 72 for a listing of all the menus with user information for each menu item.

NOTE:
Contact your MacDon dealer for information about software updates to the electronic modules. Your Dealer will have the necessary interface tools and access to the latest software upgrades.

Detailed Programming Menu Flow Chart

The programming menu flow chart is current for cab display module (CDM) software C107 and windrower control module (WCM) software M102.
OPERATOR'S STATION

This menu allows the operator to selectively "lock out" the control functions for the various header functions. The default or selected "status" for each item will flash.

**NOTE:** AUGER SPEED option only available with A40 Auger.

If the expansion module is not installed the corresponding menu items should be suppressed.

**NOTE:** REEL SPEED option only available with expansion module and draper or A40 auger.

The "arrow" keys are used to ENABLE or LOCK OUT each function. Pressing "SELECT" will go to the next L1 menu item.

**NOTE:** REEL FORE/AFT option only available with FORE/AFT installed

Tilt to be suppressed if not "installed" in the windower setup menu.

**NOTE:** HEADER TILT option only available when HYDRAULIC TILT CYLINDER is installed

When the control lock outs are viewed, the lower display line (L2) will show the engine hours and either ENABLED or LOCKED to indicate the present status along with the engine hours at which time the function was either ENABLED or LOCKED.

Using the "arrow" keys allows the operator to select the various functions. Pressing "SELECT" will go to the EXIT VIEW LOCKOUTS? menu selection.

If any of the HDR ANGLE/KNIFE SPEED or REEL SPEED sensors are not "installed" (no expansion module or A30 Auger header selected), they should be suppressed.
OPERATOR’S STATION

L1 | C x x x | ACTIVATE FUNCTIONS? | M x x x | EXIT SETUP?
L2 | M x x x | HEADER | EXIT DIAGNOSTIC?

If "NO" then jump to:

L1 | C x x x | ACTIVATE FUNCTIONS?
L2 | M x x x | REEL | DOWN / UP |

If "NO" then jump to:

L1 | C x x x | ACTIVATE FUNCTIONS?
L2 | M x x x | HEADER | DOWN / UP |

For diagnostic purposes each header function can be activated by using the "arrow" keys on the CDM. When "SELECT" is pressed the program will go to the next function that can be activated.

L1 | C x x x | ACTIVATE FUNCTIONS?
L2 | M x x x | HDR TILT | IN / OUT |

If the HEADER TILT cylinder or the REEL FORE / AFT valve is not installed under the TRACTOR SETUP menu then the ACTIVATE FUNCTIONS menu selection for these items should be suppressed.

L1 | C x x x | ACTIVATE FUNCTIONS?
L2 | M x x x | KNIFE DRIVE ON |

L1 | C x x x | ACTIVATE FUNCTIONS?
L2 | M x x x | DRAPER / AUGER ON |

L1 | C x x x | ACTIVATE FUNCTIONS?
L2 | M x x x | REEL DRIVE ON |

For DRAPER / AUGER ON and REEL DRIVE ON (A40 and Draper Headers Only) REEL DRIVE ON and DRAPER / AUGER ON are suppressed for A30 Only.

L1 | C x x x | ACTIVATE FUNCTIONS?
L2 | M x x x | REEL | AFT / FORE |

If "NO" then jump to:

L1 | C x x x | ACTIVATE HYD PURGE?
L2 | M x x x | TO ACTIVATE PURGE |

If "NO" then jump to:

L1 | C x x x | TO ACTIVATE PURGE |
L2 | M x x x | PRESS | AND | HOLD |

ACTIVATE HYD PURGE - This is to allow the operator to purge the air from a new or changed pump system. Pressing and holding the right hand "arrow" button activates a predetermined timed purge cycle. Releasing pressure on the switch or a completed cycle (timed out) will jump to the PURGE CYCLE ENDED menu selection.

L1 | C x x x | PURGE CYCLE STARTED |
L2 | M x x x | PRESS | AND | HOLD |

L1 | C x x x | PURGE CYCLE ENDED |
L2 | M x x x |

If "NO" then jump to:

L1 | C x x x | PURGE CYCLE ENDED |
L2 | M x x x | \NO | EXIT | YES |

L1 | C x x x | EXIT FUNCTION MENU?
L2 | M x x x | \NO | YES |

If "NO" then jump to:

L1 | C x x x | EXIT FUNCTION MENU?
L2 | M x x x | EXIT DIAGNOSTIC?

L1 | C x x x | EXIT DIAGNOSTIC?
L2 | M x x x | VIEW ERROR CODES?

If "NO" then jump to:

L1 | C x x x | EXIT SETUP?
L2 | M x x x | WINDROWER SETUP?

If "YES" exit to RUN screens
3.18.6 Engine Error Codes

The cab display module (CDM) displays error codes when there is a fault with one of the several sensors that monitor and control engine operation, to assist the Operator or Technician in locating a specific problem with engine operation. Refer to 8 Engine Error Codes, page 341.

3.18.7 Cab Display Module (CDM) and Windrower Control Module (WCM) Fault Codes

The CDM displays fault codes when there is a fault with one of the several sensors that monitor and control windrower operation, to assist the Operator or Technician in locating a specific problem with the windrower. Refer to 9 Cab Display Module (CDM) Error Codes, page 359.
4 Operation

4.1 Owner/Operator Responsibilities

⚠️ CAUTION

- It is your responsibility to read and understand this manual completely before operating the windrower. Contact your Dealer if an instruction is not clear to you.
- Follow all safety messages in the manual and on safety signs on the machine.
- Remember that YOU are the key to safety. Good safety practices protect you and the people around you.
- Before allowing anyone to operate the windrower, for however short a time or distance, make sure they have been instructed in its safe and proper use.
- Review the manual and all safety related items with all Operators annually.
- Be alert for other Operators not using recommended procedures or not following safety precautions. Correct these mistakes immediately, before an accident occurs.
- Do NOT modify the machine. Unauthorized modifications may impair the function and/or safety and affect machine life.
- The safety information given in this manual does NOT replace safety codes, insurance needs, or laws governing your area. Be sure your machine meets the standards set by these regulations.
4.2 Symbol Definitions

The following symbols are used to depict functions or reactions at the various instruments and controls. Learn the meaning of these symbols before operating the windrower.

4.2.1 Engine Functions

These are the symbols that are used on the console.

- P - Deck Shift
- Q - Header Disengage
- R - Header Engage
- S - Pull Up Header Engage
- T - Push Down Header Disengage
4.3 Operating the Windrower

4.3.1 Operational Safety

⚠️ CAUTION

Follow these safety precautions:

- Wear close fitting clothing and protective shoes with slip resistant soles.
- Remove foreign objects from the machine and surrounding area.
- Carry with you any protective clothing and personal safety devices that COULD be necessary through the day. Don’t take chances.
- You may need:
  - a hard hat
  - protective glasses or goggles
  - heavy gloves
  - respirator or filter mask
  - wet weather gear

- Protect against noise. Wear a suitable hearing protective device such as ear muffs or ear plugs to protect against objectionable or uncomfortable loud noises.
- Follow all safety and operational instructions given in your operator’s manuals. If you do not have a header manual, get one from your Dealer and read it thoroughly.
- Never attempt to start the engine or operate the machine except from the operator’s seat
- Check the operation of all controls in a safe clear area before starting work.
- Check for excessive vibration and unusual noises. If there is any indication of trouble, shut down and inspect the machine. Follow proper shutdown procedure. Refer to Shutting Down the Engine, page 91.
- Operate only in daylight or good artificial light.
4.3.2 Break-In Period

The windrower is ready for normal operation. However there are several items to check and watch out for during the first 150 hours.

In addition to the following, perform the items specified in Break-In Inspections, page 313.

⚠️ DANGER

Before investigating an unusual sound or attempting to correct a problem, place ground speed lever (GSL) in N-DETENT, shut off engine, and remove key.

IMPORTANT:
Until you become familiar with the sound and feel of your new windrower, be extra alert and attentive.

- Operate engine at moderate load and avoid extremely heavy or light loading for longer than 5 minutes.
- Avoid unnecessary idling. If engine will be idling longer than 5 minutes after reaching operating temperature, turn key OFF to stop engine.
- Check engine oil level frequently. Watch for any signs of leakage. If oil must be added, refer to Checking Engine Oil Level, page 227.

NOTE: During the break-in period, a higher than usual oil consumption should be considered normal.

NOTE: If windrower must be driven in cold weather (below freezing), let engine idle for 3 minutes, and then operate at moderate speed until oil has warmed up.

- Watch coolant gauge in cab for temperature rising beyond normal operating range. Check that coolant level at reserve tank (mounted next to radiator) stays between HOT and COLD marks on tank. Refer to Engine Cooling System, page 245. If over-heating problems occur, check for coolant leaks.

4.3.3 Preseason Checks/Annual Service

⚠️ CAUTION

- Review the operator’s manual to refresh your memory on safety and operating recommendations.
- Review all safety signs and other decals on the windrower and note hazard areas.
- Be sure all shields and guards are properly installed and secured. Never alter or remove safety equipment.
- Be sure you understand and have practiced safe use of all controls. Know the capacity and operating characteristics of the machine.
- Store a properly stocked first aid kit and charged fire extinguisher on the windrower.

1. Perform the following checks:
   a. Drain off excess hydraulic oil added for storage. Refer to Draining Hydraulic Oil, page 290.
   b. Remove plastic bags and/or tape from all sealed openings (air cleaner intake, exhaust pipe, fuel tank).
   c. Charge battery and install. Be sure terminals are clean and cables are connected securely.
OPERATION

d. Adjust tension on air conditioning (A/C) compressor belt. Refer to *Tensioning Air Conditioner (A/C) Compressor Belt, page 257.*

e. Distribute A/C refrigerant by cycling A/C switch. Refer to *Air Conditioning Compressor Coolant Cycling, page 87.*

f. Check the entire A/C system for leakage at the beginning of each season.

2. Perform annual maintenance. Refer to *5.7.11 Maintenance Schedule, page 313.*

*Air Conditioning Compressor Coolant Cycling*

Cycle A/C switch to distribute the air conditioning (A/C) refrigerant oil as follows:

**IMPORTANT:**
Perform the following steps whenever the machine is first started after storage for more than one week:

1. Turn blower switch (B) to first position, turn temperature control switch (A) to MAXIMUM heating, and A/C control (C) to OFF.
2. Start engine, and operate at low idle until engine is warm.
3. Click A/C switch (B) from OFF to ON for one second, then back to OFF for 5 to 10 seconds. Repeat this step ten times.

![Figure 4.6: Climate Control](image)

A - Temperature Control  B - Blower Switch  C - Air Conditioning Switch

**4.3.4 Daily Check**

1. Check the machine for leaks or any parts that are missing, broken, or not working correctly.

   **NOTE:**
   Use proper procedure when searching for pressurized fluid leaks. Refer to *Hoses and Lines, page 298.*

2. Clean the windows and mirrors to be sure of good visibility in all directions. Stand on the platform to access the rear window. Hold onto the handholds on the cab front corners and stand on the header anti-slip strips to wash the front window.

3. Clean all lights and reflective surfaces to maintain visibility to others.

4. Perform daily maintenance. Refer to *5.7.11 Maintenance Schedule, page 313.*
4.3.5 Engine Operation

Starting the Engine

⚠️ DANGER

- Avoid possible injury or death from a runaway machine.
- This machine has safety devices which allow the engine to start only when the ground speed lever is in N-DETENT, the steering wheel is locked in the NEUTRAL position, and the header drive switch is in the OFF position. Under no circumstances are these devices to be deliberately rewired or misadjusted so that the engine can be started with controls out of NEUTRAL.
- Do NOT start engine by shorting across starter or starter relay terminals. Machine will start with drive engaged and move if normal starting circuitry is bypassed.
- Start engine only from operator’s seat with controls in NEUTRAL. NEVER start engine while standing on ground. Never try to start engine with someone under or near machine.
- Before starting engine, be sure there is plenty of ventilation to avoid asphyxiation.

**IMPORTANT:**
Do NOT tow machine to start engine. Damage to hydrostatic drives will result.

⚠️ WARNING

Before starting engine, securely fasten your seat belt and ensure trainer’s seat belt is fastened if occupied. The seat belt can help ensure your safety if it is used and maintained.

1. A battery main disconnect switch (A) is located on the battery support in the engine compartment. Ensure switch is switched to POWER ON position.

![Figure 4.7: Battery Disconnect](image)
2. Move ground speed lever (GSL) (A) into N-DETENT (B).

3. Turn steering wheel until it locks. It may be possible to move the steering wheel slightly in the locked position.

**IMPORTANT:**
Do **NOT** attempt to force the wheel out of locked position as damage to the traction system may occur.

4. Fasten seat belt.

5. Push HEADER DRIVE switch (C) to ensure it is OFF.

**Normal Start**

Engine temperature above 60°F (16°C):

**WARNING**
If starter engages with steering wheel unlocked, ground speed lever out of NEUTRAL, or header clutch engaged, DO NOT START ENGINE. See your Dealer.

1. Set throttle (A) to START position—fully back.

**IMPORTANT:**
The machine gauges and instruments provide important information about machine operation and condition. Familiarize yourself with the gauges and monitor them carefully during start-up operation. Refer to 3.15 Engine Controls and Gauges, page 54.

**CAUTION**
Check to be sure all bystanders have cleared the area.

2. Sound horn (C) three times.

3. Turn ignition key (B) to RUN position. Single loud tone sounds, engine warning lights illuminate as a self-test, and cab display module (CDM) displays “HEADER DISENGAGED” and “IN PARK”.

4. Turn ignition key (B) to START position until engine starts, and then release key.

**IMPORTANT:**
• Do **NOT** operate starter for longer than 15 seconds at a time.
• If engine does not start, wait at least two minutes before trying again.
• After the third 15 second crank attempt, allow solenoid to cool for 10 minutes before further cranking attempts. If engine still does not start, refer to 6.1 Engine Troubleshooting, page 317.
**Cold Start**

Engine temperature below 40°F (5°C)

⚠️ **WARNING**

If starter engages with steering wheel unlocked, ground speed lever (GSL) out of NEUTRAL, or header clutch engaged, **DO NOT START ENGINE.** See your Dealer.

1. Set throttle (A) to START position - fully back (low idle).
2. Turn ignition key (B) to RUN.
3. Grid heater light (D) on CDM will cycle ON / OFF / ON after 2 seconds for a preset length of time. The operating period for the glow plug light will change depending on engine temperature.
4. Sound horn (C) three times.
5. When grid heater light (D) goes out, turn ignition key to START, and crank engine until it starts. Leave throttle (A) at IDLE.
6. If engine fails to start, repeat procedure beginning with step 2., *Cold Start, page 90.*

---

**IMPORTANT:**

Do **NOT** operate starter for longer than 15 seconds at a time. If engine does not start, wait at least two minutes before trying again. After the third 15 second crank attempt, allow solenoid to cool for 10 minutes before further cranking attempts. If engine still does not start, refer to 6.1 Engine Troubleshooting, page 317.

**NOTE:**

The engine will cycle through a period where it appears to labor until the engine warms up. The throttle is nonresponsive during this time as the engine is in warm-up mode. This mode will last from 30 seconds to 3 minutes depending on the temperature. After the engine has stabilized and is idling normally, the throttle becomes active.

**IMPORTANT:**

Do **NOT** operate engine above 1500 rpm until engine temperature gauge is above 100°F (40°C).
**Engine Warm-Up**

Allow engine to run with throttle lever (A) at or near low idle position until engine temperature reading on display (B) reaches approximately 100°F (40°C).

**NOTE:**
Scroll through cab display module (CDM) for engine temperature.

![Operator Console](image1.png)

**Engine Intermediate Speed Control (ISC)**

Engine ISC is useful when operating loads are reduced such as in light crop conditions that do not require the maximum engine rpm. Reduced engine speed lowers fuel consumption, noise levels, and exhaust emissions in addition to reducing engine wear.

With the ISC activated, the engine speed automatically reverts to 2300 rpm when the header is engaged.

Programming instructions are provided in [3.18.5 Cab Display Module (CDM) Programming, page 70](#).

**Shutting Down the Engine**

⚠️ **CAUTION**

*Park on a flat, level surface, header on the ground, and the ground speed lever in N-DETENT position and steering wheel locked.*

**IMPORTANT:**
Before stopping engine, run at low idle for approximately five minutes to cool hot engine parts (and allow turbocharger to slow down while engine oil pressure is available).

1. Lower header.
2. Place ground speed lever (GSL) (B) into N-DETENT.
3. Lock steering wheel.
4. Turn ignition key (A) counterclockwise to OFF position.

![Operator Console](image2.png)
Filling Fuel Tank

Fill fuel tank daily, preferably at the end of the day’s operation to help prevent condensation in the tank.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

⚠️ WARNING

• To avoid personal injury or death from explosion or fire, do NOT smoke or allow flame or sparks near fuel tank when refueling.

• NEVER refuel the windrower when the engine is hot or running.

⚠️ CAUTION

Do NOT allow tank to empty. Running out of fuel can cause air locks and/or contamination of the fuel system. Refer to System Priming, page 244.

1. Stop windrower and remove key.

2. Stand on platform to access the fuel tank filler pipe.

3. Clean the area around filler cap (A).

4. Turn cap handle (B) counterclockwise until loose and then remove cap.

5. Fill tank with approved fuel. Refer to Lubricants, Fluids, and System Capacities, page 199.

IMPORTANT:

Do NOT fill tank completely—space is required for expansion. A filled tank could overflow if exposed to a rise in temperature, such as direct sunlight.

NOTE:

Fuel tank capacity is 97 US gal. (367 L).

6. Replace fuel tank cap (A) and turn cap handle (B) clockwise until snug.
**Engine Temperature**

The normal engine operating temperature range is 180–225°F (82–107°C).

If the temperature exceeds 230°F (110°C), an ongoing intermittent tone will be heard and the cab display module (CDM) (A) will flash "ENGINE TEMP". Stop the engine immediately and determine cause. The tone will stop and the CDM (A) will return to normal when the temperature drops below 225°F (107°C).

**Engine Oil Pressure**

The nominal engine oil pressure is 10 psi (69 kPa) at low idle and 55.1 psi (380 kPa) at maximum rated speed.

If the oil pressure drops below the preset level of 7.5 psi (52 kPa), the cab display module (CDM) flashes an error code and error message.

If the STOP ENGINE light illuminates, stop the engine IMMEDIATELY and investigate.

If the yellow CAUTION light illuminates, stopping immediately is optional. You may continue operations and investigate later, but you are STRONGLY advised to monitor the situation carefully.

**Electrical**

The electrical system voltage is displayed on the cab display module (CDM) when selected with the SELECT button on the ground speed lever (GSL) handle or the SELECT switch on the CDM. The display indicates the condition of the battery and alternator.

<table>
<thead>
<tr>
<th>Ignition</th>

<td></td>
</tr>
<tr>
<td></td>
<td>Shut down</td>
<td>12.0</td>
<td>Battery normal</td>
</tr>
</tbody>
</table>

¹¹ Display flashes voltage reading with single loud tone. Repeats every 30 minutes until condition is fixed.
**Engine Warning Lights**

Four engine warning lights indicate abnormal engine conditions. Engine warning lights should **NOT** be illuminated under normal operating conditions.

- **ENGINE PRE-HEAT (A)** illuminates yellow. Wait to start engine.
- **WATER IN FUEL (B)** illuminates yellow. Service recommended.
- **CAUTION (C)** illuminates yellow. Prompt attention is required. Refer to display (E) for malfunction code.
- **STOP (D)** illuminates red. Stop engine immediately. Refer to display (E) for malfunction code.
- **DISPLAY (E)** shows the malfunction code. For details, refer to 8 Engine Error Codes, page 341.

**4.3.6 Windrower Operation**

⚠️ **WARNING**

The seat belt can help ensure your safety if it is used and maintained.

- Before starting the engine, securely fasten your seat belt. Ensure that anyone occupying the trainee’s seat is secured by a seat belt as well.
- Never wear a seat belt loosely or with slack in the belt system. Never wear the belt in a twisted condition or pinched between the seat structural members.

⚠️ **WARNING**

- Avoid driving the machine with header removed. Removing header decreases the weight on drive wheels, reducing steering control.
- If necessary to drive machine with header removed, use transmission field speed range, do **NOT** exceed 1500 rpm engine speed and avoid loose gravel and slopes.
- Never use windrower as a towing vehicle when header is removed, except as instructed in **Towing Header with Windrower, page 104**. There is insufficient weight on the drive wheels to provide steering control.
- Because of windrower shape characteristics, a roll-over protected (ROPS) cab is not required. If operating with header removed, be aware that cab structure will **NOT** withstand a roll-over.

⚠️ **CAUTION**

**HYDROSTATIC STEERING**

- Turning the steering wheel varies the hydraulic flow to one drive wheel relative to the other drive wheel.
- The reaction of this type of steering is different from conventional steering mechanisms.
CAUTION

• With the engine running, moving the ground speed lever out of N-DETENT unlocks steering. Any movement of steering wheel will then cause the machine to move, even if the ground speed lever has not been moved forward or rearward from the NEUTRAL position.

• Hydrostatic steering is more sensitive than mechanical steering.

• Steering is opposite to normal when driving in reverse.

• The brakes are only on when the ground speed lever (GSL) is in N-DETENT and the steering wheel is centered and locked.

DANGER

• NEVER move the ground speed lever or steering wheel until you are sure all bystanders have cleared the area.

• Make sure area is clear before making turns, as the ends of a header travel in a large arc.

• Check the operation of all controls in a safe, clear area before starting work.

• Do know the capacity and operating characteristics of your machine.

• Do NOT allow riders in or on the machine.

• Do NOT operate unless seated in the operator's position.

• Do NOT attempt to get on or off a moving windrower.

• AVOID sudden starts and stops.

• AVOID inclines, ditches, and fences.

• Do NOT rapidly accelerate or decelerate when turning.

• REDUCE your speed before turning, crossing slopes, or travelling over rough ground.

• Do NOT allow anyone to stand behind the machine while operating. Foreign objects may be forcibly ejected.
Ingress/Egress

⚠️ CAUTION

To provide more secure hand and foot mobility, preventing slipping and possible injury, ALWAYS face the windrower and use the hand rail when dismounting (or mounting).

- NEVER attempt to get on or off a moving windrower.

Before leaving the operator's seat for any reason:

- Park on level ground if possible.
- Be sure ground speed lever is in N-DETENT and steering wheel is locked in the straight-ahead position.
- Fully lower header and reel.
- Disengage header drives.
- Stop engine and remove key from ignition. A child or even a pet could engage an idling machine.
- Turn off wipers.
- Turn off lights unless required for inspection purposes.
- Release seat belt.
- Raise armrest and steering wheel for easier exit and re-entry.
- Lock the cab door when leaving the windrower unattended. (When the door is locked, it can still be opened from inside the cab.)

A swing away platform and steps (A) are provided to accommodate access to the operator’s station, as well as maintenance tasks.

Opposite to the entry/exit door (B) is a door-size window (C) that latches in the partially open position if desired, and can be fully opened for emergency exit.

Figure 4.16: Platforms and Doors
OPERATION

To open right side window, pull over-center latch (A) forward, and slightly push on window until latch goes over-center, and lock window in OPEN position.

To close right side window, pull latch (A) inward to until window closes, and then push rearward to lock.

To fully open window, pull pin (B) out of latch, and push window open.

Figure 4.17: Right Side Window

Driving Forward

CAUTION

Operate both steering wheel and ground speed lever slowly for familiarization. Avoid the common tendency of new Operators to oversteer.

1. Place ground speed lever (GSL) (A) in N-DETENT. Engine can be running.
2. Ensure seat belt is fastened.
4. Set GROUND SPEED RANGE switch (B) to either of the following:
   - 2 for road speed: 0–16 mph (25.7 km/h)
   - 1 for field speed: 0–11 mph (17.7 km/h)
5. The cab display module (CDM) will display an engine status at (C).
6. Slowly push throttle (D) to full forward (operating speed). The CDM should display 2270–2330 rpm at (E).

CAUTION

Check again to be sure all bystanders have cleared the area.

7. Move the GSL (A) out of N-DETENT and slowly forward to desired speed which will be displayed at (F).

IMPORTANT:

The windrower can be equipped with an automatic steering system for use in the field. An automated steering system is available as an option and can be installed by a MacDon Dealer. The GSL has been pre-wired at the factory with a switch. Also refer to 7.1.3 Automated Steering Systems, page 337.
Driving in Reverse

**WARNING**

Back up slowly. Steering is opposite to normal when reversing. Hold steering wheel at the bottom and turn wheel in direction you want the rear of the machine to travel.

1. Set ground speed range switch (A) to 1 (field speed).
2. Move throttle lever (B) to a mid-range position.

**NOTE:**
Reversing in field speed range and at reduced engine speed is recommended since steering will be less sensitive than at higher speed settings.

**CAUTION**

Check again to be sure all bystanders have cleared the area.

3. Move the ground speed lever (GSL) rearward to desired speed.
4. Steer as shown.

**Spin Turning**

Hydrostatic steering provides significantly more manoeuvrability than mechanical steering.

**CAUTION**

Be sure area is clear before making turns. Although windrower pivots on the spot, the ends of the header travel faster and in a large arc.
1. Move the ground speed lever (GSL) (A) out of N-DETENT towards the seat and hold.

2. Slowly turn the steering wheel in the desired direction of turn. The windrower will pivot between the drive wheels.

3. To increase the turn radius, slowly move the GSL away from NEUTRAL. Remember that this will increase ground speed as well.

4. To stop the turn, slowly turn the steering wheel back to its centered position.

**Stopping**

⚠️ **WARNING**

Do NOT move ground speed lever rapidly back to NEUTRAL. You may be thrown forward by sudden stop. Always wear seat belt when operating windrower.

To stop the windrower:

1. **SLOWLY** return the ground speed lever (GSL) (A) to NEUTRAL and into N-DETENT.

2. Turn steering wheel until it locks.

3. Move throttle lever (B) to low idle position.

   **NOTE:**

   Avoid unnecessary idling. Stop engine if it will be idling for longer than 5 minutes.

4. Brakes are automatically engaged when steering wheel is locked in NEUTRAL position.

⚠️ **CAUTION**

Park on a flat, level surface, header on the ground, and the GSL in N-DETENT and steering wheel locked.

**IMPORTANT:**

Before stopping engine, run at low idle for approximately 5 minutes to cool hot engine parts (and allow turbocharger to slow down while engine oil pressure is available).

5. Turn ignition key counterclockwise to OFF position.
4.3.7 Adjusting Caster Tread Width

The rear casters can be adjusted to a narrow tread width to allow loading and shipping without having to remove them.

A narrow tread width also suits smaller headers by allowing more space to the uncut crop and provides more manoeuvrability around poles, irrigation inlets, or other obstacles.

A wider tread width is useful in heavy crops that produce large windrows so that runover is reduced.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

⚠️ CAUTION

Park on a flat, level surface, header on the ground, and the ground speed lever in N-DETENT position and steering wheel locked.

Adjust the caster tread width as follows:

1. Raise rear of windrower slightly so that most of the weight is off the casters, using a jack or other lifting device under the frame at (B).

   NOTE:
   Lifting device should have a lifting capacity of at least 5000 lb (2270 kg).

2. Remove six bolts (A) four on backside, two on underside, and washers from left and right side of walking beam.

3. Slide extensions inboard or outboard equal amounts and align holes at desired location.

   NOTE:
   Use the caster wheels to assist in moving the axle by rotating the caster so that wheel is parallel to the axle.
IMPORTANT:
Caster wheels must be equidistant from center of windrower.

4. Position bracket (A) and install back bolts (C). The two shorter bolts are installed at the back inboard locations.
5. Install bottom bolts (B).
6. Tighten bolts as follows:
   a. Snug bottom bolts (B).
   b. Tighten and torque back bolts (C) to 330 ft lbf (447 N·m).
   c. Tighten and torque bottom bolts (B) to 330 ft lbf (447 N·m).
7. Lower windrower to ground.

IMPORTANT:
Torque bolts after first 5 and 10 hours of operation.

4.3.8 Transporting the Windrower

Driving on the Road

⚠️ WARNING
Collision between windrower and other vehicles may result in injury or death.

⚠️ WARNING
When driving windrower on public roadways:
• Obey all highway traffic regulations in your area. Use pilot vehicles in front and rear of windrower if required by law.
• Use slow moving vehicle emblem and flashing warning lights unless prohibited by law.
• If width of attached header impedes other vehicle traffic, remove header and install a MacDon approved weight box.
**WARNING**

Do NOT drive windrower on a road or highway at night, or in conditions that reduce visibility, such as fog or rain. The width of the windrower may not be apparent under these conditions.

**CAUTION**

Operate both steering wheel and ground speed lever slowly for familiarization. Remember that steering is more sensitive when ground speed-range control switch is set to ROAD position - 2. Avoid the common tendency of new Operators to oversteer.

**CAUTION**

Check local laws for width regulations and lighting and marking requirements before transporting on roads.

Before driving windrower on a roadway:

1. Ensure HEADER DRIVE switch (A) is pushed to OFF position (down).
2. Clean flashing amber lamps, red tail lamp and head lamps, and check that they work properly.
3. Clean all reflective surfaces and slow moving vehicle emblems.
4. Adjust interior rear view mirror and clean windows.
5. Push LIGHT switch (A) to ROAD position to activate lamps. Always use these lamps on roads to provide warning to other vehicles.
   a. Use HIGH / LOW LIGHTS (B) as required when other vehicles are approaching.
   b. Do NOT use FIELD lamps on roads, other drivers may be confused by them.
6. Push BEACON switch (C) ON to activate beacons.
7. Press switch (A) on cab display module (CDM) to activate hazard lights.

8. Set ground speed range switch (A) to 2 for ROAD speed. CDM will display ROAD GEAR at (B).

**NOTE:**
Windrower can be moving, but speed must be less than 5 mph (8 km/h) for road gear to engage.

9. Slowly push throttle (C) to full forward (operating speed). CDM should display 2270–2330 rpm at (D).

10. Slowly move the ground speed lever (GSL) (E) forward to desired speed which will be displayed at (F).

11. If towing a header, refer to *Towing Header with Windrower, page 104.*

---

**WARNING**

To avoid serious injury or death from loss of control:
- Do **NOT** make abrupt changes in steering direction.
- Anticipate turns and steep slopes by slowing down well in advance.
- Do **NOT** rapidly accelerate or decelerate while turning.

When travelling on steep slopes:
- Move ground speed lever (GSL) closer to NEUTRAL to reduce speed.
- Lower header.
- Set GROUND SPEED RANGE switch to 1 - field speed.

With header removed, steering control is reduced if weight is not added to drive wheels. If you must drive the windrower without header or MacDon weight system:
- Operate in 1 – field speed range.
- Do **NOT** exceed 1500 rpm engine speed.
- Avoid loose gravel and slopes.
- Do **NOT** tow a header.
- If control of machine is lost, immediately pull ground speed lever (GSL) to NEUTRAL.
Towing Header with Windrower

The windrower can be used to tow a MacDon draper header that has the optional slow speed transport option installed, **PROVIDED** the optional weight box is installed on the windrower or an approved header transporter with weight transfer to the lift arms.

**WARNING**

Draper Header with Transport Option Installed

- The windrower without the header must **NOT** be used to tow headers due to reduced traction and possible loss of control unless a weight box option ([7.1.20 Weight Box, page 340](#)) is installed on the windrower or a header transporter that transfers weight to the lift arms.

**CAUTION**

- To tow a header for transporting with an M105 Self-Propelled Windrower, the header must be equipped with the appropriate equipment to comply with all local regulations.
- Before each towing trip, a pre-trip inspection must all be conducted to verify that all signal lighting and safety equipment is installed and functioning properly.
- Do **NOT** connect any towed implement except for header transport trailers for 20–25-foot D-Series headers or 30–35-foot D-Series headers that are equipped with the slow speed transport option.
- Tongue weight must **NOT** exceed 500 lbs (227 kg).
- Do **NOT** exceed the specified Combined Gross Vehicle Weight (CGVW).
- To prevent machine damage and/or loss of control, it is essential that the machine be equipped such that weights are within the following limits:

<table>
<thead>
<tr>
<th>Description</th>
<th>lbs</th>
<th>kg</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum GVVW (includes mounted implements)</td>
<td>17,750</td>
<td>8050</td>

</tbody>
</table>

**Figure 4.32: Maximum Weight**
Converting from Field to Transport Mode

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

⚠️ DANGER

To avoid bodily injury from fall of raised header, always engage safety props when working on or around raised header, and before going under header for any reason.

1. Set header on the ground (field position).

2. Disconnect the following hydraulic and electrical connections:
   a. **Left Side** – Store hydraulic hoses and electrical cable into the storage position. Refer to header operator's manual.
   b. **Right Side** – Release the multi-link and place into storage on windrower. Refer to header operator's manual.

3. Retrieve temporary lift pin from storage location on weight box and install into **rear hole (A)** at the top of the lift arms. This provides additional lift height for transport wheel deployment.

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.

4. Raise header to full height and stop engine.

5. Engage safety props on lift cylinders. Refer to 4.4.1 Header Safety Props, page 117.

7. Remove float pin from engaged position (A) and insert in storage location (B). Secure with lynch pin.

8. Remove pins (A) from lower end of lift linkages.

**NOTE:**
Pins (A) are also used to secure weight box to windrower linkage.

9. Release the safety props on the header lift cylinders. (Refer to 4.4.1 Header Safety Props, page 117.)

10. Start engine and lower header down onto the transport wheels.

11. Use the HEADER TILT switches to release load on the cylinder if necessary.

12. Shut down engine and remove key from ignition.
Disconnect the center-link as follows:

**Hydraulic Link**

13. If using hydraulic link, disconnect the center-link as follows:
   a. Pull up on latch (A), and position latch into notch (B) on top of hook.
   b. Release safety props on the header lift cylinders ([4.4.1 Header Safety Props, page 117](#)).
   c. Lower header down onto the transport wheels.
   d. Disengage top link from the header. If necessary, use the HEADER TILT switch to release load on the cylinder.

**Mechanical Link**

14. If using a mechanical link, disconnect the center-link as follows:
   a. Loosen nut (A), and rotate barrel (B) to relieve load on link.
   b. Remove cotter pin (D) on pin (C), and remove pin to disconnect from windrower. Reinstall pin in header.

15. Back windrower away from header.
16. Remove tow-bar sections from storage locations on header, assemble, and attach to header. Refer to header operator's manual.

Attach optional weight box to windrower as follows:

⚠️ **CAUTION**

To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and NOT installed at hole location (A).
17. Drive windrower so that windrower lift arms are located in the weight box pockets.

18. Raise lift arms slightly.

19. Stop engine, and remove key.

20. Install locking pins (A) into pockets and through windrower header lift linkages. Secure with hairpin.

**NOTE:**

Pins (A) were previously removed from the header lift linkage lower end.

At rear of windrower, lower the drawbar bracket as follows:

21. Hold drawbar support (A), and remove the two pins (B) at the forward end.

22. Lower support to position shown, and reinstall the two pins (B) in uppermost pair of holes in support.

23. Alternative drawbar (C) can be removed if desired.
The optional M105 transport drawbar (MD #B5411) mounts to the walking beam and provides approximately 12 in. (300 mm) of fore-aft movement to ease the attachment of a towed implement. Refer to 7.1.18 Transport Drawbar, page 340 for more information.

Attach the tow-bar to the windrower as follows:

24. Back the windrower up to the tow-bar (A) so that the drawbar hole (B) is within 6 in. (150 mm) (D) of the tow-bar clevis pin (C).

25. Stop engine, and remove key.

26. If the tow-bar (A) is TOO FAR from the drawbar (B):
   a. Remove pin (C), lift the drawbar support (D) until the tow-bar clevis aligns, and then install the drawbar pin (E).
   b. Start engine, and gently reverse the windrower until the drawbar support pivots down to transport position.
   c. Stop engine, and remove key.
   d. Reinstall pin (C) to secure drawbar support, and connect the safety chain. Proceed to step 28., Converting from Field to Transport Mode, page 110.

IMPORTANT:
Ensure lynch pins are secure in all three pins, and that the drawbar pin is also secured by a locking pin.
27. If the tow-bar (A) is **TOO CLOSE** to the windrower:
   a. Remove pin (B), lower the drawbar support (C) until the tow-bar clevis aligns, and then install the drawbar pin (D).
   b. Start engine, and gently drive the windrower forward until the drawbar support pivots up to transport position.
   c. Stop engine, and remove key.
   d. Reinstall pin (B).

28. Connect safety chain (A) through the slot in the drawbar support (B), and securely attach the hook (C) to the chain. Leave enough slack to allow the hitch to pivot.
29. At the drawbar, connect the tow-bar harness plug (A) to the receptacle on the windrower.

30. At the LH float spring tower, attach connector (A) on windrower harness to towing harness receptacle (B).

31. Confirm that the flashing amber and signal lights on header function properly.

32. Before moving the machine, double check that all pins are secure, the drawbar and hitching components are not showing signs of damage, and that all safety equipment is installed and fully functional.

Converting from Transport Mode to Field Operation

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Stop engine and remove key from ignition.
2. Disconnect electrical harness at connector (B) from windrower and store harness (A) on weight box.

3. Disconnect electrical harness (A) from windrower, and store harness on tow-bar.

4. Undo lock (A), remove safety chain (B) from drawbar, and remove clevis pin (C).
5. Move tow-bar off drawbar.

6. At rear of windrower, remove pins (A), lift drawbar support (B) to horizontal position, and reinstall pins (a) as shown.

7. Alternative drawbar (C) is used for attaching a tow-bar behind swath roller.

**IMPORTANT:**
Do **NOT** use alternative drawbar for any other purpose.

**IMPORTANT:**
To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and **NOT** installed at hole location (A).
9. Remove pins (A) securing lift linkages to weight box, and retain pins for attaching header to windrower.

10. Start engine, lower weight box onto blocks, and back away.

11. Attach header to windrower. Refer to 4.5.1 Attaching a D-Series Header, page 131.

12. Convert header to field position. Refer to header operator’s manual for procedure.

13. Start engine, and lower header to ground. Continue to retract lift cylinders so that member (A) lifts off link (B).

14. Remove temporary lift pins (C) from lift arms, and install pins into storage holes in weight box.

15. Before operating the machine, double check that all pins are secure, and that all safety equipment is installed and fully functional.

16. Proceed to operate the header.

---

**Towing the Windrower (Emergency)**

In emergency situations, for example, towing out of a field or into a shop, windrower may be towed without a trailer, providing the following precautions are followed:

⚠️ **WARNING**

A proper towing apparatus is critical to safe towing. Use the following guidelines:

- Do NOT attach directly from hitch to walking beam. Slope of tow-bar will not provide proper transfer of braking force to windrower, causing loss of control.

- For proper steering, towing apparatus should be attached to BOTH left and right hand frame members, and should attach to tow-bar at same height as towing vehicle hitch.

- Towing apparatus should be removed for field operation, to avoid interference with windrow.

---

**Figure 4.54: Weight Box**

**Figure 4.55: Lift Arms**

**Figure 4.56: Improper Towing Procedure**
**WARNING**

With final drives disengaged, the windrower may roll on a sloped surface. Before disengaging final drives, attach windrower to towing vehicle. After towing, engage drives and ensure ground speed lever (GSL) is in N-DETENT before detaching from towing vehicle.

![Figure 4.57: Correct Towing Procedure](image)

**IMPORTANT:**
- Failure to disengage final drives before towing will result in serious transmission damage.
- Do **NOT** exceed 16 mph (26 km/h) when towing windrower.
- Do **NOT** use this towing method for normal transporting of windrower.
- Even with final drives disengaged, rolling speeds of more than 16 mph (26 km/h) will cause final drive gears to run at excessive speeds, possibly severely damaging or causing the unit to fail.

**Final Drives**

Disengage and engage final drives as follows:

1. Remove the two bolts (A) at the center of drive wheel.
2. Remove cap (B) and flip over so that dished side faces in. The cap depresses a pin that disengages the gearbox.
3. After towing, reverse cover (B) to engage final drives. Be sure plunger at center of wheel pops out to engage drive.

![Figure 4.58: Final Drives](image)

**4.3.9 Storing the Windrower**

At the end of each operating season, you need to store your windrower properly.

**WARNING**

Never use gasoline, naphtha, or any volatile material for cleaning purposes. These materials are toxic and can be flammable.
CAUTION

Never operate engine in a closed building. Proper ventilation is required to avoid exhaust gas hazards.

CAUTION

Remember when working around storage batteries that all of the exposed metal parts are live. Never lay a metal object across the terminals because a spark and short circuit will result.

1. Clean the windrower thoroughly.
2. Store windrower in a dry protected place.
3. Remove battery. Refer to Removing Battery, page 266.
4. Bring to full charge and store in a cool, dry place not subject to freezing.
5. If stored outside, always cover windrower with a waterproof tarpaulin or other protective material. This will protect the switches, instruments, tires, etc. from inclement weather.
6. If no cover is available; seal air cleaner intake and exhaust pipe with plastic bags and/or waterproof tape.
7. If possible, block up windrower to take weight off tires. If it is not possible to block up the machine, increase tire pressure by 25% for storage. Adjust to recommended operating pressure before next use.
8. Repaint all worn or chipped painted surfaces to prevent rust.
9. Lubricate the windrower thoroughly, leaving excess grease on fittings to keep moisture out of bearings. Apply grease to exposed threads and sliding surfaces of components.
10. Check for worn components and repair. Tighten loose hardware and replace any missing hardware. Refer to 5.2 Torque Specifications, page 186.
11. Check for broken components and order replacements from your Dealer. Attention to these items right away will save time and effort at beginning of next season.
12. Add approved rust inhibitor to the engine oil in accordance with the manufacturer’s instructions. Run engine to operating temperature to mix inhibitor with oil, unless otherwise specified.
13. To prevent condensation, fill hydraulic oil reservoir to filler neck with approved hydraulic system oil. Refer to Checking and Filling Hydraulic Oil, page 288.
14. Test engine coolant antifreeze concentration to ensure it is sufficient to protect engine against lowest expected temperature.
4.4 Operating with a Header

The M105 Self-Propelled Windrower is designed to use the MacDon A-Series Auger Header, and D65 Rigid Draper Header (up to 35-foot), with or without a Hay Conditioner.

This section describes the attachment and detachment procedures and operating instructions for these header types.

4.4.1 Header Safety Props

Safety props are located on both header lift cylinders on the windrower.

⚠️ DANGER

To avoid bodily injury from fall of raised header, always engage safety props when working on or around raised header, and before going under header for any reason.

Engage safety props as follows:

1. Start engine and press HEADER UP (A) switch to raise header to maximum height.

2. Rephase cylinders if one end of the header does not raise fully. If rephasing is needed, proceed as follows:
   a. Press and hold the HEADER UP (A switch until both cylinders stop moving.
   b. Continue to hold the switch for 3–4 seconds. Cylinders are phased.

![Figure 4.59: Ground Speed Lever (GSL)](image)
3. Pull lever (A) and rotate toward header to lower safety prop (B) onto cylinder. Repeat for opposite cylinder.

4. To disengage safety props and for storage, turn lever (A) away from header to raise safety prop until lever locks into vertical position. Repeat for opposite cylinder.

5. Start engine, choose a level area, and lower header to the ground. Stop engine and remove key.
4.4.2 Header Float

Float is intended for cutting crops that require the cutterbar to be in contact with the ground. Optimum float is for the cutterbar to maintain contact with the ground with minimum bouncing and scooping or pushing soil. The machine will perform best with minimum extra weight on the header.

IMPORTANT:

- To avoid frequent breakage of knife components, scooping soil, or soil build-up at cutterbar in wet conditions, header float should be set as light as possible without causing excessive bouncing.
- When float setting is light, it may be necessary to use a slower ground speed to avoid excessive bouncing and leaving a ragged cut.
- The stabilizer wheels are designed to minimize bouncing at the header ends and **NOT** float the header. Refer to your header operator’s manual for float setting and adjustment guidelines.

**Float Operating Guidelines**

When working with the cutterbar on the ground:

1. Set center-link to mid-range position (05.0 on cab display module [CDM]). Refer to 4.4.5 Adjusting Header Angle, page 124.
2. In rocky fields, adjust skid shoes down to raise guards when operating at flattest header angle to minimize scooping rocks.
3. Adjust header height or adjust header angle to minimize pushing soil.

When working with the cutterbar off the ground (draper header only):

1. Set center-link to mid-range position (05.0 on CDM). Refer to 4.4.5 Adjusting Header Angle, page 124.
2. The proper setting requires balancing the amount of header weight carried by the float and stabilizer wheels. Refer to your draper header operator’s manual.
3. Use the CDM controls to automatically maintain cutting height. Refer to 4.4.6 Cutting Height, page 127.
Checking Float

**Figure 4.62: Cab Display Module (CDM) Float Adjustment**

A - CDM Display  B - Header Tilt Down  C - Header Tilt Up  D - Header Up  E - Header Down

Check header float as follows:

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

⚠️ **CAUTION**

Check to be sure all bystanders have cleared the area.

1. Start the engine.
2. If hydraulic center-link is installed, use HEADER TILT switches (B, C) to set center-link to mid-range position (5.0 on CDM [A]).
3. Using HEADER DOWN switch (E), lower header fully with lift cylinders fully retracted.
4. Shut down the engine and remove the key.
5. Grasp the divider rod at the end of the header and lift. The force to lift should be as noted in the following table and should be approximately the same at both ends.

<table>
<thead>
<tr>
<th>Header</th>
<th>Force Required to Lift Header at the Ends with Lift Cylinder Fully Retracted</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auger</td>
<td>75–85 lbf (335–380 N)</td>
</tr>
<tr>
<td>Draper</td>
<td>75–85 lbf (335–380 N) with stabilizer/transport wheels raised (if equipped).</td>
</tr>
</tbody>
</table>
Adjusting Float Using Drawbolts

Float adjustment uses drawbolts to change the tension on the springs in the lift linkages.

If necessary, adjust the float with the drawbolts as follows:

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.

1. Start engine.
2. Using HEADER UP (A) switch on ground speed lever (GSL), raise the header fully, shut down engine, and remove key.
3. Turn drawbolt (A) clockwise to increase float (makes header lighter) or counterclockwise to decrease float (makes header heavier).
4. Recheck the header float as described in Checking Float, page 120.

4.4.3 Levelling the Header

The windrower linkages are factory-set to provide the proper level for the header and should not normally require adjustment.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.
If the header is not level, perform the following checks prior to adjusting the levelling linkages.

**NOTE:**
The float springs are **NOT** used to level the header.

- Raise header to full height, and keep HEADER UP switch pressed to ensure lift cylinders are phased.
- Check drive wheel tire pressures.
- Check and set float adjustment. Refer to *Checking Float, page 120.*

To level the header, follow these steps:

1. Place float pins in locked out location (A).

2. Park windrower on level ground.

3. Set header approximately 6 in. (150 mm) off ground and check that member (A) is against link (B). Note the high and low end of header.

4. Place wooden blocks under header cutterbar and legs.
5. Lower header onto blocks so that member (A) lifts off link (B) on both sides.

6. Stop engine and remove key.

7. On high side, remove nut, washer, and bolt (A) that attaches shims (B) to link.

8. Remove one or both shims (B) and reinstall the hardware (A).

**CAUTION**

Check to be sure all bystanders have cleared the area.

9. Start engine and raise header slightly. Check level of header.

10. If additional levelling is required, install the removed shim on the opposite linkage.

**NOTE:**
If required, additional shims are available from your Dealer.

11. Once header is level, return float pins to their engaged position (A).

**NOTE:**
Float does **NOT** require adjustment after levelling header.
4.4.4 Header Drive

The headers are hydraulically driven and controlled from the windrower with no mechanical drive shafts.

One hydraulic piston pump on the windrower provides fluid power to the knife, and three gear pumps power the drapers or auger, reel, lift, and positioning systems and optional attachments.

All header controls are conveniently located on the operator’s console and on the ground speed lever (GSL) handle.

**NOTE:**
Some controls are optional equipment and may not be present in your unit. Some controls may be installed, but will be nonfunctional for certain headers.

*Engaging and Disengaging the Header*

**IMPORTANT:**
Always move throttle lever back to idle before engaging header drive. Do **NOT** engage header with engine at full rpm.

**CAUTION**

Check to be sure all bystanders have cleared the area.

1. **To Engage Header:**
   a. Move throttle (A) to adjust engine speed to idle.
   b. Push down on the yellow knob in the center of the HEADER DRIVE switch (B) and pull up on the black ring at the base of the switch. A slight delay between switch ON and operating speed is normal.

2. **To Disengage Header:**
   a. Push HEADER DRIVE switch (B) down to disengage header drive.

![Figure 4.70: Operator Console](image)

4.4.5 Adjusting Header Angle

Header angle is defined as the angle between the ground and the drapers/cutterbar and is adjustable to accommodate crop conditions and/or soil type.

Refer to the appropriate header operator’s manual for the range of adjustment and recommended settings for your particular header.

The header angle can be hydraulically adjusted from the cab without shutting down the windrower. A readout on the cab display module (CDM) allows you to establish settings for each crop condition. This feature requires that the optional expansion module MD #B4666 be installed, either at the factory or at your MacDon Dealer.
**OPERATION**

**IMPORTANT:**
- Changing header angle will affect flotation slightly because it has the effect of making the header lighter or heavier.
- To prevent excessive guard breakage when conditions are not suited to heavier float (e.g., rocky or wet), do **NOT** use the TILT CONTROL “on the go”. Instead, use the HEADER HEIGHT switch.

![Operator Console Diagram](image)

**Figure 4.71: Operator Console**
- A - Program Button
- B - Display
- C - Header Tilt Down
- D - Header Tilt Up
- E - Display Selector

Change header angle as follows:

**Hydraulic Link (Optional)**
- To decrease (flatten) header angle, operate HEADER TILT UP switch (C) on ground speed lever (GSL) handle so that cylinder retracts. The CDM display will show a reading on the lower line of decreasing value between 00.0 and 10.0.
- To increase (steepen) header angle, operate HEADER TILT DOWN switch (D) on GSL handle so the cylinder extends. The CDM display will show a reading on the lower line of increasing value between 00.0 and 10.0.
- The HEADER TILT switch can be deactivated to prevent inadvertent header angle changes when pressing the HEADER HEIGHT control switches. Refer to **3.18.5 Cab Display Module (CDM) Programming, page 70**.

1. Switch to PROGRAM mode on CDM.
2. Press SELECT until SET CONTROL LOCKS? is displayed.
3. Press the right arrow to display HEADER TILT.
4. Press the right arrow to LOCK (deactivate) the control.
5. Press PROGRAM (A) to exit.
Checking Self-Locking Center-Link Hook

Periodically check the operation of the hook locking mechanism and ensure that it is working properly as follows:

1. If header is attached to windrower, disconnect center-link hook from header by pulling up on handle (A) to release the locking device and then lifting the hook off the header pin.

2. Lower the handle (A) into the LOCK position.

3. Push up on lock pin (B) only. Handle should catch on casting and pin should NOT lift.

4. Push up on actuator rod (C) and lock pin should lift with the handle.
### 4.4.6 Cutting Height

Cutting height is adjusted by raising or lowering the header with the HEADER UP (B) or HEADER DOWN (C) switches on the ground speed lever (GSL).

The cab display module (CDM) indicates header height with a reading on the DISPLAY (A) lower line between 00.0 and 10.0, with 00.0 being on the ground.

Use DISPLAY SELECTOR switch (D) to display the current setting.

**Return to Cut**

The M-Series monitoring system will assist you in maintaining the desired cutting height with the RETURN TO CUT feature. This feature can be turned OFF or ON with a switch on the cab display module (CDM).

The return to cut (RTC) feature provides preset cutting height and tilt angle settings for the header.

**NOTE:**
To enable the RTC header tilt feature, the optional hydraulic center-link and expansion module must be installed. Refer to 7.1.12 Hydraulic Center-Link, page 339 and 7.1.10 Expansion Module, page 338.

If desired, the CDM can be programmed so only the cutting height feature is active. The unit will default to cutting height only if no hydraulic center-link or expansion module is installed.

Refer to the following procedures:

- *Programming Return to Cut Feature, page 128*
- *Using Return to Cut Feature, page 129*
Program the RETURN TO CUT (RTC) feature as follows:

**IMPORTANT:**
To enable the RTC header tilt feature, the hydraulic center-link and expansion module options must be installed.

**CAUTION**
Check to be sure all bystanders have cleared the area.

1. Start and windrower and engage the header.
2. Set RETURN TO CUT switch (A) to OFF (indicator light is OFF).
3. Adjust the header to the desired cutting height with the HEADER UP (B) or HEADER DOWN (C) switches on the ground speed lever (GSL). The cab display module (CDM) displays between 00.0 and 10.0 at (D).
4. Adjust the header angle with the HEADER TILT UP (E) or HEADER TILT DOWN (F) switches on the GSL. The CDM displays between 00.0 and 10.0. This step is not required when height only has been preselected.
5. Press the RETURN TO CUT switch (A) on the CDM. The indicator light will illuminate and the settings are now programmed into the windrower control module (WCM).
Using Return to Cut Feature

Use the RETURN TO CUT feature as follows:

**IMPORTANT:**
Ensure the header is engaged and the RETURN TO CUT switch (A) is illuminated.

**NOTE:**
The header can be raised or lowered by **pressing and holding** the HEADER UP (B) or HEADER DOWN (C) switches on the ground speed lever (GSL).

1. If header is above the preset cutting height, **momentarily press** HEADER DOWN switch (C) and the header will return to preset height.
2. If the header is below the preset height, **press and hold** the HEADER UP (B) switch to raise the header. Release switch to stop header. Alarm will sound when header rises past the preset height.
3. If the header angle changes (for machines equipped with optional hydraulic center-link and expansion module), double-click (two clicks within 0.5 seconds) the HEADER TILT UP (E) or HEADER TILT DOWN switch (F) and the header will return to the preset angle.

**NOTE:**
If the header cannot return to the preset height or angle within 30 seconds, the RETURN TO CUT feature will deactivate to prevent the hydraulic oil from overheating. Push the RETURN TO CUT switch (A) to reactivate.
4.4.7 Swath Roller Operation

Refer to the operating instructions that are provided with an optional Swath Roller kit. Refer to 7.1.15 Swath Roller, page 339 for more information.
4.5 Attaching and Detaching Headers

4.5.1 Attaching a D-Series Header

Refer to the procedure that is appropriate for the center-link installed on the windrower:

- Attaching a D-Series Header: Hydraulic Center-Link, page 131
- Attaching a D-Series Header: Mechanical Center-Link, page 136

**Attaching a D-Series Header: Hydraulic Center-Link**

**NOTE:**
This topic assumes that draper header boots have already been attached to the windrower lift linkage. If that is not the case, refer to 4.6.2 Attaching Header Boots, page 168.

To attach a D-Series header to a windrower equipped with a hydraulic center-link, follow these steps:

⚠️ **DANGER**
Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Remove the hairpin (A) from pin (B) and remove the pins from both header legs.

![Figure 4.78: Header Leg](image)

⚠️ **CAUTION**
Check to be sure all bystanders have cleared the area.

2. Start engine and activate HEADER DOWN button (A) on the ground speed lever (GSL) to fully retract header lift cylinders.

![Figure 4.79: GSL](image)
3. If necessary, relocate the pin (A) at the frame linkage as required to raise the center-link (B) so that the hook (B) is above the attachment pin on the header.

**IMPORTANT:**
If the center-link is too low, it may contact the header as the windrower approaches the header for hookup.

4. Slowly drive the windrower forward so the boots (A) enter the header legs (B). Continue to drive slowly forward until lift linkages contact the support plates in the header legs and the header nudges forward.

5. Ensure that lift linkages are properly engaged in header legs, contacting the support plates.

6. Activate HEADER TILT cylinder switches on ground speed lever (GSL) to extend or retract center-link cylinder so that the hook lines up with the header attachment pin.

7. Stop engine and remove key from ignition.
8. Push down on rod end of link cylinder (B), until hook engages pin on header and is locked.

**IMPORTANT:**
Hook release must be down to enable self-locking mechanism. If the release is open (up), manually push it down after hook engages header pin.

9. Check that center-link (A) is locked onto header by pulling upward on rod end (B) of cylinder.

⚠️ **CAUTION**

*Check to be sure all bystanders have cleared the area.*

10. Start engine and press the HEADER UP switch (A) to raise header to maximum height.

**NOTE:**
If one end of the header does NOT raise fully, rephase the cylinders as follows:

a. Press and hold the HEADER UP switch until both cylinders stop moving.

b. Continue to hold the switch for 3–4 seconds. Cylinders are now phased.
11. Engage safety props on both lift cylinders as follows:
   a. Stop engine and remove key from ignition.
   b. Pull lever (A) and rotate toward header to release and lower the cylinder stop (B) onto cylinder.
   c. Repeat for the opposite lift cylinder.

12. Install the pin (B) through header leg, (engaging U-bracket in lift linkage) on both sides and secure with hairpin (A).

13. Raise header stand (D) to storage position by pulling spring pin (C) and lifting stand into uppermost position. Release spring pin (C).
14. Remove clevis pin from storage position (B) in linkage and insert in hole (A) to engage float springs. Secure with hairpin.

15. Disengage safety prop by turning lever (A) downward to release and lower stop until lever locks into vertical position.

16. Repeat for opposite safety prop.

⚠️ CAUTION
Check to be sure all bystanders have cleared the area.

17. Start engine and activate HEADER DOWN switch (A) on GSL to lower header fully.

18. Stop engine and remove key.
19. Connect header drive hoses (A) and electrical harness (B) to header. Refer to the draper header operator's manual.

![Figure 4.90: Header Drive Hoses and Harness](image)

20. Connect reel hydraulics (A) at right-hand side of windrower. Refer to the draper header operator’s manual.

![Figure 4.91: Reel Hydraulics](image)

**Attaching a D-Series Header: Mechanical Center-Link**

**NOTE:**
This topic assumes that draper header boots have already been attached to the windrower lift linkage. If that is not the case, refer to 4.6.2 Attaching Header Boots, page 168.

To attach a D-Series header to a windrower equipped with a mechanical center-link, follow these steps:

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.
1. Remove the hairpin (A) from pins (B) and remove the pins from header legs.

⚠️ **CAUTION**

Check to be sure all bystanders have cleared the area.

2. Start engine and activate HEADER DOWN button (A) on the ground speed lever (GSL) to fully retract header lift cylinders.

**IMPORTANT:**
If the center-link is too low, it may contact the header as the windrower approaches the header for hookup.

3. Slowly drive the windrower forward so the boots (A) enter the header legs (B). Continue to drive slowly forward until lift linkages contact the support plates in the header legs and the header nudges forward.

4. Ensure that lift linkages are properly engaged in header legs, contacting the support plates.

5. Stop engine and remove key from ignition.
6. Loosen nut (A) and rotate barrel (B) to adjust length so that the link lines-up with header bracket.

7. Install clevis pin (C) and secure with cotter pin (D).

8. Adjust link to required length for proper header angle by rotating barrel (B). Tighten nut (A) against barrel. A slight tap with a hammer is sufficient.

![Figure 4.95: Mechanical Center-Link](image)

**CAUTION**

Check to be sure all bystanders have cleared the area.

9. Press the HEADER UP switch (A) to raise header to maximum height.

**NOTE:**

If one end of the header does **NOT** raise fully, rephase the cylinders as follows:

a. Press and hold the HEADER UP switch until both cylinders stop moving.

b. Continue to hold the switch for 3–4 seconds. Cylinders are now phased.

![Figure 4.96: GSL](image)
10. Engage safety props on both lift cylinders as follows:
   a. Stop engine and remove key from ignition.
   b. Pull lever (A) and rotate toward header to release and lower the safety prop (B) onto cylinder.
   c. Repeat for the opposite lift cylinder.

11. Install pin (B) through header leg, (engaging U-bracket in lift linkage) on both sides and secure with a hairpin (A).

12. Raise header stand (D) to storage position by pulling spring pin (C) and lifting stand into uppermost position. Release spring pin (C).
13. Remove clevis pin from storage position (B) in linkage and insert in hole (A) to engage float springs. Secure with hairpin.

14. Disengage safety prop by turning lever (A) downward to release and lower stop until lever locks into vertical position.

15. Repeat for opposite safety prop.

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.

16. Start engine and activate HEADER DOWN switch on GSL (A) to lower header fully.

17. Stop engine and remove key.
18. Connect header drive hoses (A) and electrical harness (B) to header. Refer to the draper header operator’s manual.

19. Connect reel hydraulics (A) at right-hand side of windrower. Refer to the draper header operator’s manual.

4.5.2 Detaching a D-Series Header

Refer to the procedure that is appropriate for the center-link installed on the windrower:

- Detaching a D-Series Header: Hydraulic Center-Link, page 142
- Detaching a D-Series Header: Mechanical Center-Link, page 145
Detaching a D-Series Header: Hydraulic Center-Link

To detach a D-Series header from an M-Series windrower equipped with a hydraulic center-link, follow these steps:

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Start engine and press HEADER UP (A) switch to raise header to maximum height.
2. Rephase cylinders if one end of the header does not raise fully. If rephasing is needed, proceed as follows:
   a. Press and hold the HEADER UP (A switch until both cylinders stop moving.
   b. Continue to hold the switch for 3–4 seconds. Cylinders are phased.
3. Stop engine and remove key.
4. Pull lever (A) and rotate toward header to lower safety prop (B) onto cylinder. Repeat for opposite cylinder.
5. Remove the pin (B) by removing the hairpin (A) from header leg on both sides.

6. Lower header stand (D) by pulling spring loaded pin (C). Release spring pin to lock stand.

7. Remove clevis pin from location (A) to disengage float springs and insert in storage hole (B). Secure with lynch pin.

⚠️ CAUTION

To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and NOT installed at hole location (A).

8. To disengage safety props and for storage, turn lever (A) away from header to raise safety prop until lever locks into vertical position. Repeat for opposite cylinder.
9. Disconnect header drive hydraulics (A) and electrical harness (B) from header and store in support on windrower left cab-forward side. Refer to the draper header operator’s manual for further information.

![Figure 4.109: Header Drive Hydraulics](image)

10. Disconnect reel hydraulics (A) from header and store on bracket at windrower left cab-forward side. Refer to the draper header operator’s manual for further information.

![Figure 4.110: Reel Hydraulics](image)

**CAUTION**

Check to be sure all bystanders have cleared the area.

11. Start engine and activate HEADER TILT cylinder switch on ground speed lever (GSL) to release load on center-link cylinder.

![Figure 4.111: GSL](image)

A - Header Tilt Up  
B - Header Tilt Down
12. Disconnect center-link by lifting release (B) and lift hook (A) off header.

**NOTE:** If optional center-link self-alignment kit is installed, lift release (B) and then operate the link lift cylinder with REEL UP switch on GSL to disengage the center-link from the header.

**NOTE:** If hay conditioner is installed, watch clearances on both sides.

13. Reinstall pin (A) into header leg and secure with a hairpin (B).

---

**Detaching a D-Series Header: Mechanical Center-Link**

To detach a D-Series header from an M-Series windrower equipped with mechanical center-link, follow these steps:

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Start engine and press HEADER UP (A) switch to raise header to maximum height.
2. If one end of the header does **NOT** raise completely, rephase the cylinders as follows:
   a. Press and hold the HEADER UP (A) switch on the ground speed lever (GSL) until both cylinders stop moving.
   b. Continue to hold the switch for 3–4 seconds. Cylinders are phased.
3. Stop engine and remove key.
4. To engage the safety props, pull lever (A) and rotate toward header to lower safety prop (B) onto cylinder. Repeat for the opposite cylinder.

5. Remove the clevis pin (B) by removing hairpin (A) from header leg on both sides.

6. Lower header stand (D) by pulling spring loaded pin (C). Release pin to lock stand.
7. Remove the clevis pin from location (A) to disengage float springs and insert in storage hole (B). Secure with lynchpin.

⚠️ CAUTION

To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and NOT installed at hole location (A).

8. To disengage safety props and for storage, turn lever (A) away from header to raise safety prop until lever locks into vertical position. Repeat for opposite cylinder.

9. Disconnect header drive hydraulics (A) and electrical harness (B) from header and store in support on windrower left cab-forward side. Refer to the draper header operator’s manual for further information.
10. Disconnect reel hydraulics (A) from header and store on bracket at windrower left cab-forward side. Refer to the draper header operator’s manual for further information.

11. Loosen nut (A) and rotate barrel (B) to relieve load on link.

12. Remove cotter pin on clevis pin (D) and remove the pin (C) to disconnect from windrower. Reinstall clevis pin (C) in header.

13. Tighten nut (A) against barrel. A slight tap with a hammer is sufficient.

14. Reinstall pin (A) into header leg and secure with a hairpin (B).

4.5.3 Attaching an A-Series Header

Refer to the procedure that is appropriate for the center-link installed on the windrower:

- Attaching an A-Series Header: Hydraulic Center-Link, page 149
- Attaching an A-Series Header: Mechanical Center-Link, page 154
OPERATION

Attaching an A-Series Header: Hydraulic Center-Link

To attach an A-Series header to a windrower equipped with a hydraulic center-link, follow these steps:

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Remove hairpin (A) from clevis pin (B) and remove the clevis pin from left and right header boots (C) on header.

⚠️ **CAUTION**

To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and NOT installed at hole location (A).

⚠️ **CAUTION**

Check to be sure all bystanders have cleared the area.

2. Start the engine and activate HEADER DOWN button (A) on the ground speed lever (GSL) to fully retract header lift cylinders.
3. If necessary, relocate pin (A) at the frame linkage as required to raise the center-link (B) so that the hook is above the attachment pin on the header.

**IMPORTANT:**
If the center-link is too low, it may contact the header as the windrower approaches the header for hookup.

4. Slowly drive the windrower forward so the feet (A) on the windrower enter the boots (B) on the header. Continue to drive slowly forward until the feet engage the boots and the header nudges forward.

5. Activate HEADER TILT cylinder switches on ground speed lever (GSL) to extend or retract center-link cylinder so that the hook lines up with the header attachment pin.

6. Stop engine and remove key from ignition.
7. Push down on rod end of link cylinder (B), until hook engages pin on header and is locked.

**IMPORTANT:**
Hook release must be down to enable self-locking mechanism. If the release is open (up), manually push it down after hook engages header pin.

8. Check that center-link (A) is locked onto header by pulling upward on rod end (B) of cylinder.

---

**CAUTION**

Check to be sure all bystanders have cleared the area.

9. Start engine and press the HEADER UP switch (A) to raise header to maximum height.

**NOTE:**
If one end of the header does **NOT** raise fully, the lift cylinders require rephasing. If rephasing is needed, proceed as follows:

a. Press and hold the HEADER UP switch until both cylinders stop moving.

b. Continue to hold the switch for 3–4 seconds. Cylinders are now phased.
10. Engage safety props on both lift cylinders as follows:
   a. Stop engine and remove key from ignition.
   b. Pull lever (A) and rotate toward header to release and lower the safety prop (B) onto cylinder.
   c. Repeat for the opposite lift cylinder.

11. Install clevis pin (A) through each boot and foot, and secure with hairpin. Do this to both sides.

**IMPORTANT:**
Ensure clevis pin (A) is fully inserted and hairpin is installed behind bracket.
12. Remove lynch pin from clevis pin (A) in stand (B).
13. Hold stand (B) and remove pin (A).
14. Position stand to storage position by inverting stand and relocating on bracket as shown. Reinsert clevis pin (A) and secure with lynch pin.

15. Remove clevis pin from storage position (B) in linkage, and insert in hole (A) to engage float springs. Secure with hairpin.

16. Disengage safety prop by turning lever (A) downward to release and lower safety prop until lever locks into vertical position.
17. Repeat for opposite safety prop.
CAUTION

Check to be sure all bystanders have cleared the area.

18. Start engine and activate HEADER DOWN switch (A) on GSL to lower header fully. Stop engine and remove key.

19. Connect header drive hoses (A) and electrical harness (B) to header. Refer to the auger header operator's manual.

Attaching an A-Series Header: Mechanical Center-Link

To attach an A-Series header to a windrower equipped with a mechanical center-link, follow these steps:

DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.
1. Remove hairpin (A) from clevis pin (B) and remove pin from left and right header boots (C) on header.

⚠️ CAUTION

To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and NOT installed at hole location (A).

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.

2. Start the engine and activate HEADER DOWN button (A) on the ground speed lever (GSL) to fully retract header lift cylinders.
3. Slowly drive the windrower forward so the feet (A) on the windrower enter the boots (B) on the header. Continue to drive slowly forward until the feet engage the boots and the header nudges forward.

4. Stop engine and remove key from ignition.
5. Loosen nut (A) and rotate barrel (B) to adjust length so that the link lines-up with header bracket.
6. Install clevis pin (C) and secure with cotter pin (D).
7. Adjust link to required length for proper header angle by rotating barrel (B). Tighten nut (A) against barrel. A slight tap with a hammer is sufficient.

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.

8. Start engine and press the HEADER UP switch (A) to raise header to maximum height.

**NOTE:**
If one end of the header does **NOT** raise fully, the lift cylinders require rephasing. If rephasing is needed, proceed as follows:

a. Press and hold the HEADER UP switch until both cylinders stop moving.

b. Continue to hold the switch for 3–4 seconds. Cylinders are now phased.
9. Engage safety props on both lift cylinders as follows:
   a. Stop engine and remove key from ignition.
   b. Pull lever (A) and rotate toward header to release and lower the safety prop (B) onto cylinder.
   c. Repeat for the opposite lift cylinder.

10. Install clevis pin (A) through each boot and foot, and secure with hairpin. Do this to both sides.

**IMPORTANT:**
Ensure clevis pin (A) is fully inserted and hairpin is installed behind bracket.
11. Remove lynch pin from clevis pin (A) in stand (B).
12. Hold stand (B) and remove pin (A).
13. Position stand to storage position by inverting stand and relocating on bracket as shown. Reinsert clevis pin (A) and secure with lynch pin.

14. Remove clevis pin from storage position (B) in linkage, and insert in hole (A) to engage float springs. Secure with hairpin.

15. Disengage safety prop by turning lever (A) downward to release and lower safety prop until lever locks into vertical position.
16. Repeat for opposite safety prop.
CAUTION

Check to be sure all bystanders have cleared the area.

17. Start engine and activate HEADER DOWN switch (A) on GSL to lower header fully. Stop engine and remove key.

18. Connect header drive hoses (A) and electrical harness (B) to header. Refer to the auger header operator’s manual.

4.5.4 Detaching an A-Series Header

Refer to the procedure that is appropriate for the center-link installed on the windrower:

- Detaching an A-Series Header: Hydraulic Center-Link, page 160
- Detaching an A-Series Header: Mechanical Center-Link, page 163
Detaching an A-Series Header: Hydraulic Center-Link

To detach an A-Series header from a windrower with hydraulic center-link, follow these steps:

⚠️ WARNING

Stop engine, and remove key before making adjustments to the machine. A child or even a pet could engage the drive.

1. Start engine and press HEADER UP button (A) on ground speed lever (GSL) to raise header to maximum height.

2. If one end of the header does NOT raise fully, rephase the cylinders as follows:
   a. Press and hold the HEADER UP (A) switch until both cylinders stop moving
   b. Continue to hold the switch for 3–4 seconds. Cylinders are phased.

3. Stop engine and remove key.

⚠️ DANGER

To avoid bodily injury from fall of raised header, always engage safety props when working on or around raised header, and before going under header for any reason.

4. Pull lever (A) and rotate toward header to lower safety prop (B) onto cylinder. Repeat for opposite cylinder.
5. Remove hairpin from the clevis pin (A) and remove the clevis pin from left and right header boots (B).

![Figure 4.153: Header Boot](image)

6. Lower the stand (A) by pulling clevis pin (B), inverting stand, and relocating on bracket. Reinsert pin (B) and secure with hairpin.

![Figure 4.154: Header Stand](image)

7. Remove the clevis pin from linkage (A) to disengage float springs and insert in storage hole (B). Secure with lynch pin. Repeat for opposite linkage.

**CAUTION**

To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and **NOT** installed at hole location (A).

![Figure 4.155: Header Lift Linkage](image)
8. To disengage safety props and for storage, turn lever (A) away from header to raise safety prop until lever locks into vertical position. Repeat for opposite cylinder.

![Figure 4.156: Safety Props](image)

**CAUTION**

Check to be sure all bystanders have cleared the area.

9. Start engine, choose a level area, and lower header to the ground.

10. Activate HEADER TILT cylinder switch on ground speed lever (GSL) to release load on center-link cylinder.

![Figure 4.157: GSL](image)

A - Header Tilt Up  
B - Header Tilt Down

11. Stop engine, and remove key from ignition.

12. Lift hook release (C) and lift hook (B) off header pin.

**NOTE:**

If optional center-link self-alignment kit is installed, lift release (C), and then operate the link lift cylinder with REEL UP switch on GSL to disengage the center-link from the header.

![Figure 4.158: Hydraulic Center-Link](image)
13. Disconnect header drive hydraulics (A) and electrical harness (B). Refer to the auger header operator’s manual.

14. Slowly back windrower away from header.

15. Reinstall clevis pin (B) and secure with hairpin (A) in header boot (C).

16. Repeat for the opposite side.

Detaching an A-Series Header: Mechanical Center-Link

⚠️ WARNING

Stop engine, and remove key before making adjustments to machine. A child or even a pet could engage the drive.

1. Start engine and press HEADER UP button (A) on ground speed lever (GSL) to raise header to maximum height.

2. If one end of the header does NOT raise fully follow these steps to rephase the cylinders:
   a. Press and hold the HEADER UP (A) switch until both cylinders stop moving
   b. Continue to hold the switch for 3–4 seconds. Cylinders are phased.

3. Stop engine and remove key.
DANGER

To avoid bodily injury from fall of raised header, always engage safety props when working on or around raised header, and before going under header for any reason.

4. Pull lever (A) and rotate toward header to lower safety prop (B) onto cylinder. Repeat for opposite cylinder.

5. Remove hairpin from the clevis pin (A) and remove clevis pin from the left and right header boots (B).
6. Lower the header stand (A) by pulling clevis pin (B), inverting stand, and relocating on bracket. Reinsert clevis pin (B) and secure with hairpin.

7. Remove clevis pin from linkage (A) to disengage float springs and insert in storage hole (B). Secure with lynch pin. Repeat for opposite linkage.

**CAUTION**

To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and NOT installed at hole location (A).

8. To disengage safety props and for storage, turn lever (A) away from header to raise safety prop until lever locks into vertical position. Repeat for opposite cylinder.

9. Start engine, choose a level area, and lower header to ground.

10. Stop engine and remove key from ignition.
11. Loosen nut (A) and rotate barrel (B) to relieve load on link.
12. Remove cotter pin (D) on clevis pin (C) and remove pin to disconnect from header.
13. Reinstall clevis pin in header.

14. Disconnect header drive hydraulics (A) and electrical harness (B). Refer to the auger header operator's manual.
15. Slowly back windrower away from header.

16. Reinstall clevis pin (B) and secure with hairpin (A) in header boot (C).
17. Repeat for the opposite side.
4.6 Operating with a D-Series Header

4.6.1 Configuring Hydraulics

The windrower must be fitted with a draper drive basic kit to operate D-Series draper headers.

Windrowers equipped with D-Series hydraulics have four header drive hoses on the LH side.

There are also up to five reel drive hoses on the RH side.

If necessary, obtain the following kit from your MacDon Dealer.

- Base Kit MD #B5577 (Installation instruction MD #169537 is supplied with the kit.)
4.6.2 Attaching Header Boots

Header boots are required to attach a D-Series Draper Header to the windrower.

⚠️ CAUTION

To prevent damage to the lift system when lowering header lift linkages without a header or weight box attached to windrower, ensure that float engagement pin is installed in storage location (B) and NOT installed at hole location (A).

If **NOT** installed, attach draper header boots (supplied with header) to windrower lift linkage as follows:

1. Remove pin (B) from boot (A).

2. Position boot (B) on lift linkage (A) and reinstall pin (C). Pin may be installed from either side of boot.

3. Secure pin (C) with hairpin (D).

4. Repeat for opposite side.

4.6.3 Header Position

Refer to **4.4 Operating with a Header, page 117** for procedures for controlling header height, header tilt, and float.
**4.6.4 Reel Fore-Aft Position**

Press and hold the switch for the desired FORWARD (A) or AFT (B) movement of the reel.

![Figure 4.175: Ground Speed Lever (GSL)](image)

**4.6.5 Reel Height**

Press and hold the switch for the desired movement of the reel REEL UP (A) or REEL DOWN (B).

**IMPORTANT:**
Under certain conditions, with reel raised to full height, the reel tines may contact the cab roof. Exercise care to avoid damage to the machine.

![Figure 4.176: Ground Speed Lever (GSL)](image)

**4.6.6 Reel Speed**

The reel speed is controlled with switches on the Ground Speed Lever (GSL) in the cab. On D-Series draper headers, it can be set relative to the ground speed of the windrower using the HEADER INDEX feature or can run independently. Refer to the operator’s manual for your specific header for windrowing guidelines and recommended speeds.

*Reel to Ground Speed*

Setting the speed of the reel relative to ground speed (using the HEADER INDEX function) allows you to run the engine at lower rpm while maintaining the desired ground and reel speed. Reducing engine speed saves fuel and reduces noise in the cab.

**NOTE:**
The header index feature requires the optional expansion module. Refer to 7.1.10 Expansion Module, page 338.
This mode requires setting the **MINIMUM REEL SPEED** and the **REEL INDEX**.

**Figure 4.177: Operator Console**

A - Display  
B - Header Index  
C - Fast  
D - Slow  
E - Display Selector

**IMPORTANT:**
Windrower can be moving, but must be less than minimum reel speed.

1. Set the **MINIMUM REEL SPEED** as follows:
   a. Engage header.
   b. Set HEADER INDEX switch (B) to **ON**.
   c. On ground speed lever (GSL), press DISPLAY SELECTOR (E) to display **##.## MIN REEL** or press FAST (C) or SLOW (D) switch.  
      ###.## = RPM or MPH or KPH
   d. Press FAST (C) or SLOW (D) until desired minimum reel speed is displayed.

**NOTE:**
The reel will continue operating at the Minimum Reel Speed setting when ground speed drops below this value.  
DISPLAY (A) will flash **##.## MIN REEL** (RPM or MPH or KPH) to prompt you to change the minimum set-point or increase ground speed if Ground Speed Plus Index is **LESS THAN** the Minimum Reel Speed Set-Point.

2. Set the **REEL INDEX** as follows:
   a. Set HEADER INDEX (B) switch to **ON**.
   b. On GSL press DISPLAY SELECTOR (E) to display **##.## #.## REEL IND** or press FAST (C) or SLOW (D) switch.  
      ###.## = RPM or MPH or KPH, -1.9 to +3.0

12. As per settings in CDM programming
c. Press FAST (C) or SLOW (D) until desired reel index is displayed.

Examples:

Windrower is operating at 8 mph with HEADER INDEX ON and set at -1.0.

- Display shows **7.0 -1.0 REEL IND** where 7.0 (8.0-1.0) is the reel speed in mph and -1.0 is the HEADER INDEX setting.

Windrower speed drops to 7.5 mph at same HEADER INDEX setting.

- Display shows **6.5 -1.0 REEL IND** where 6.5 (7.5-1.0) is the reel speed in mph and -1.0 is the HEADER INDEX setting.

Windrower is operating at 8 mph with HEADER INDEX ON and set at 2.0.

- Display shows: **10.0 2.0 REEL IND** where 10.0 (8+2.0) is the reel speed in mph and 2.0 is the HEADER INDEX setting.

### 4.6.7 Draper Speed

Draper speed affects the orientation of stalks in the windrow. Faster draper speeds tend to form herringbone or dovetail configurations. Refer to your header operator’s manual for guidelines on what speed to use.

The draper speed can be set with switches on the cab display module (CDM) relative to the ground speed of the windrower with the HEADER INDEX function or can run independently.

**Draper to Ground Speed**

Setting the speed of the draper relative to ground speed using the HEADER INDEX function allows you to run the engine at lower rpm while maintaining the desired ground and draper speed. Reducing engine speed saves fuel and reduces noise in the cab.

This mode requires setting the **MINIMUM DRAPER SPEED** and setting the **DRAPER INDEX**.

Refer to the following:

- Setting Draper Minimum Speed, page 172
- Setting Draper Index, page 173
**Setting Draper Minimum Speed**

**IMPORTANT:**
Windrower can be moving, but must be LESS THAN minimum reel speed.

Set DRAPER MINIMUM SPEED as follows:

1. Engage header.
2. Set HEADER INDEX (B) switch to **ON**.
3. Press DISPLAY SELECTOR (E) for DRAPER MIN.
4. On cab display module (CDM) press SLOW (D) until beep is heard.
5. Display (A) shows **##.## DRAPER MIN**.

---

13. DISPLAY will flash #.# MIN CONV (MPH or KPH) to prompt you to change the minimum set point, or increase ground speed if Ground Speed Plus Index is **less than** the Minimum Draper Speed Set Point.
Setting Draper Index

**Figure 4.179: Operator Console**
A - Display  
B - Header Index  
C - Draper Fast  
D - Draper Slow  
E - Display Selector

Set DRAPER INDEX as follows:

**IMPORTANT:**
Windrower can be moving, but must be GREATER THAN minimum reel speed.

1. Engage header.
2. Set HEADER INDEX switch (B) to **ON**.
3. Press DISPLAY SELECTOR (E) so that DRAPER INDEX is displayed at (A).
4. On cab display module (CDM) press DRAPER FAST (C) or SLOW (D) until desired index is displayed at (A).
   
   Display shows **##.## ##.# DRAP IND**.
   
   ##.## = MPH or KPH
   
   ##.# = -1.9 to +3.0
Examples:

- Windrower is operating at 8 mph with HEADER INDEX ON and set at 1.5.
  Display shows: **9.5 1.5 DRAP INDX**
  where **9.5** (8 + 1.5) is the draper speed in mph and **1.5** is the HEADER INDEX setting.
- Windrower speed drops to 7.5 mph at same HEADER INDEX setting.
  Display shows: **9.0 1.5 DRAP INDX**
  where **9.0** (7.5 + 1.5) is the draper speed in mph and **1.5** is the HEADER INDEX setting.
- Windrower is operating at 8 mph with HEADER INDEX ON and set at 0.9.
  Display shows: **8.9 0.9 DRAP INDX**
  where **8.9** (8 + 0.9) is the draper speed in mph and **0.9** is the HEADER INDEX setting.

**Setting Draper Speed Independent of Ground Speed**

![Operator Console Diagram](image)

**Figure 4.180: Operator Console**

- **A** - Display
- **B** - Header Index
- **C** - Draper Fast
- **D** - Draper Slow
- **E** - Display Selector

Set the speed of the draper independently of ground speed as follows:

**NOTE:**
This procedure can also be used to change the draper speed "on the go".

⚠️ **CAUTION**
Check to be sure all bystanders have cleared the area.
OPERATION

1. Engage header.
2. Set HEADER INDEX switch (B) to OFF.
3. Press DISPLAY SELECTOR (E) to display at (A) DRAPER SPEED.
4. On cab display module (CDM) press FAST (C) or SLOW (D) until desired draper speed is displayed at (A). Display shows ##.# DRAPER SPEED.
   ##.# = MPH or KPH

4.6.8 Knife Speed

The ideal cutting speed of the knife should be such that a clean cut is achieved. Crop types and conditions usually influence the knife and forward speeds. Refer to the header operator’s manual for more information on knife speeds.

The knife speed is manually set by making adjustments to the knife drive pump, and has been preset at the lowest knife rpm. For optimum performance, adjust the knife speed according to the header being used. Refer to the following table.

If the machine is equipped with the appropriate sensor and optional module, the cab display module (CDM) will notify you when the knife speed reaches an overload preset (usually 75% of knife speed).

The preset can be changed on the CDM. Refer to 3.18.5 Cab Display Module (CDM) Programming, page 70.

NOTE:
The knife speed should be set within the range specified for each header.

Setting Knife Speed (with Expansion Module MD #4666)

\textbf{DANGER}

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

\textsuperscript{14} Revolutions per minute - Speed of knife drive box pulley
\textsuperscript{15} Strokes per minute of knife (rpm x 2)
1. Start engine. Refer to *Starting the Engine, page 88*.

2. Move throttle to adjust engine speed to IDLE.

3. Set the intermediate speed control (ISC) to OFF. Refer to *Engine Intermediate Speed Control (ISC), page 91*.

4. Engage header.

5. Run engine at maximum rpm.

6. Press SELECTOR button (B) on the ground speed lever (GSL) until the CDM (A) displays the knife speed in SPM (strokes per minute). This indicates that the optional expansion module (MD #B4666) is installed.

7. If knife speed is **NOT** displayed, the optional expansion module is not installed, proceed to *Setting Knife Speed (without Expansion Module MD #B4666), page 177*.

8. Compare the reading to Table 4.1 *D-Series Knife Speed*, page 175.

9. If required, adjust knife speed as follows:

10. Shut down engine, and open engine hood.

11. Locate the knife drive pump (A) and knife speed adjuster screw (B) under the right (cab forward) side of the windrower.

**NOTE:**  
The knife speed adjuster screw may have a plastic cap (B) covering it. Pull this cap off to expose the screw.
12. Loosen jam nut (A).
13. Turn adjuster screw (B) clockwise (screw in) to decrease knife speed, and counterclockwise (screw out) to increase the knife speed.

**NOTE:**
One turn of the adjuster screw (B) will change the knife speed by approximately 116 strokes per minute (spm), or the knife drive box pulley speed by 58 revolutions per minute (rpm).

14. Once adjustment has been made, torque jam nut (A).
15. Close hood, start engine, and recheck knife speed.

**Setting Knife Speed (without Expansion Module MD #B4666)**

1. Check header knife drive box pulley speed with a handheld tachometer.
2. Multiply the rpm reading by 2 to obtain the knife speed in strokes per minute.
3. Compare reading to Table 4.1 D-Series Knife Speed, page 175.
4. If required, adjust knife speed. Refer to Step 9., Setting Knife Speed (with Expansion Module MD #4666), page 176.
4.6.9 Deck Shift Control

When connected to a draper header with the deck shift option, hydraulic deck shift control allows you to select the deck position and draper rotation of the header from the operator’s station. It selects crop delivery from the left side, center, or right side of the header.

Deck Shift

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.

Shift decks as follows:

1. Engage header by pushing down on the yellow HEADER DRIVE button (A), and pulling up on the black ring at the base of the switch.

2. Push the rocker switch to desired delivery position. Deck(s) will move and direction of drapers will change accordingly.

3. Operate windrower.
4.7 Operating with an A-Series Header

The M105 is factory-equipped to run an A-Series Auger Header.

4.7.1 Auger Speed

This feature requires that the optional expansion module (MD #B4666) be installed, either at the factory or at your MacDon Dealer.

Auger Speed on A30-D Headers

On A30-D Auger Headers, the auger speed is fixed to the knife speed.

NOTE:
Auger speed can be independently changed from the knife speed by changing the auger drive sprocket. Refer to the A30-D and A40-D Pull-Type Mower Conditioner and Self-Propelled Auger Header Operator’s Manual (MD #169000).

Display the auger speed as follows:
1. Engage header.
2. Set HEADER INDEX switch (B) to OFF
3. On ground speed lever (GSL), press DISPLAY SELECTOR switch (E) for ###.# AUGER SPEED ###.# = 00.0–99.0
4. Press FAST (C) or SLOW (D) on CDM until desired auger speed is displayed at (A).
Auger speed **NOT** to exceed 320 rpm.

**Auger Speed on A40-D Headers**

On A40-D double knife headers, the auger speed is interdependent on reel speed, and is controlled by a switch on the ground speed lever (GSL).

![Operator Console](image)

**CAUTION**

Check to be sure all bystanders have cleared the area.

Change auger speed as follows:

1. Engage header.
2. Set HEADER INDEX switch (B) to **OFF**
3. On ground speed lever (GSL), press DISPLAY SELECTOR switch (E) until ##.# AUGE SPEED is displayed.
   
   Display (A) shows ##.# AUGE SPEED\(^{16}\).

   \[
   \text{##.#} = 4.7 \text{ to } 9.9
   \]

4. Press FAST (C) or SLOW (D) on CDM until desired auger speed is displayed at (A).

---

\(^{16}\) Auger speed not to exceed 320 rpm.
4.7.2 Reel Speed

Refer to your header operator’s manual for recommended reel speed settings for your particular crop.

Reel Speed on A30-D Headers

The reel speed is fixed to the auger speed and to the knife speed. Both can be changed by installing alternate drive sprockets. Refer to your auger header operator’s manual.

Reel Speed on A40-D Headers

The A40-D Auger Header features a hydraulic direct drive reel with an operating speed range of 15–50 rpm that is controlled with switches on the cab display module (CDM) and on the ground speed lever (GSL) at the operator’s station.

The hydraulic flows for the reel and auger are interconnected so that the auger and reel speeds are controlled using the GSL switches.

Figure 4.189: Operator’s Console

1. Engage header.
2. Set HEADER INDEX switch (B) to OFF.
3. On ground speed lever (GSL), press DISPLAY SELECTOR switch (E) until ##.# AUGER SPEED is displayed ( ##.# = 4.7–9.9)
4. On ground speed lever (GSL), press DISPLAY SELECTOR switch (E) until ##.# REEL SPEED is displayed
5. On ground speed lever (GSL), press REEL SLOW (F) or REEL FAST (E) until desired speed is reached. DISPLAY (A) shows ##.## REEL RPM.
### REEL RPM, MPH, KPH

**NOTE:**
Auger Speed **NOT** To Exceed 320 rpm.

#### 4.7.3 Knife Speed

The ideal cutting speed of the knife should be such that a clean cut is achieved. Crop types and conditions usually influence the knife and forward speeds.

The knife speed is manually set by making adjustments to the knife drive pump, and has been preset at the lowest knife rpm.

For optimum performance, adjust the knife speed according to the header being used. Refer to the following table.

If the machine is equipped with the appropriate sensor and optional module, the cab display module (CDM) will notify you when the knife speed reaches an overload preset (usually 75% of knife speed).

The preset can be changed on the CDM. Refer to **3.18.5 Cab Display Module (CDM) Programming, page 70**.

**NOTE:**
The knife speed should be set within the range specified for each header.

**Table 4.2 A-Series Knife Speed**

<table>
<thead>
<tr>
<th>Header Description</th>
<th>Knife Speed</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum</td>
</tr>
<tr>

<td>775</td>
</tr>
<tr>
<td>Auger A40-D</td>
<td>700</td>
</tr>
</tbody>
</table>

**Setting Knife Speed (With Expansion Module MD #4666 Installed)**

**DANGER**

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Start engine. Refer to **Starting the Engine, page 88**.
2. Move throttle to adjust engine speed to IDLE.
3. Set the intermediate speed control (ISC) to OFF. Refer to **Engine Intermediate Speed Control (ISC), page 91**.
4. Engage header.
5. Run engine at maximum rpm.

---

17. rpm = speed of knife drive box pulley (revolutions per minute)
18. spm = strokes per minute of knife (rpm x 2)
6. Press SELECTOR button (B) on the ground speed lever (GSL) until the CDM (A) displays the knife speed in SPM (strokes per minute). This indicates that Optional Expansion Module MD #B4666 is installed.

7. If knife speed is NOT displayed, the optional expansion module is not installed, proceed to .

8. Compare reading to Table 4.2 A-Series Knife Speed, page 182.

9. If required, adjust knife speed as follows:

10. Shut down engine, and open engine hood.

11. Locate the knife drive pump (A) and knife speed adjuster screw (B) under the right (cab forward) side of the windrower.

**NOTE:**
The knife speed adjuster screw may have a plastic cap (B) covering it. Pull this cap off to expose the screw.
12. Loosen jam nut (A).

13. Turn adjuster screw (B) clockwise (screw in) to decrease knife speed, and counterclockwise (screw out) to increase the knife speed.

**NOTE:**
One turn of the adjuster screw (B) will change the knife speed by approximately 116 strokes per minute (spm), or the knife drive box pulley speed by 58 revolutions per minute (rpm).

14. Once adjustment has been made, torque jam nut (A).

15. Close hood, start engine, and recheck knife speed.

**Setting Knife Speed (Without Expansion Module MD #B4666)**

1. Check header knife drive box pulley speed with a handheld tachometer.

2. Multiply the rpm reading by 2 to obtain the knife speed in strokes per minute.

3. Compare reading to Table 4.2 A-Series Knife Speed, page 182.

4. If required, adjust knife speed. Refer to step 9., Setting Knife Speed (With Expansion Module MD #4666 Installed), page 183.
5 Maintenance and Servicing

The following section is intended to guide you through some of the windrower’s basic maintenance and service requirements.

More detailed maintenance, service, and parts information is available from your MacDon Dealer.

5.1 Preparation For Servicing

WARNING

To avoid personal injury, before servicing adapter/header or opening drive covers:

• Fully lower the header. If necessary to service in the raised position, always engage lift safety props.
• Disengage drives.
• Stop engine, and remove key.
• Wait for all moving parts to stop.
5.2 Torque Specifications

The following tables give correct torque values for various bolts, cap screws, and hydraulic fittings.

- Tighten all bolts to the torques specified in chart (unless otherwise noted throughout this manual).
- Replace hardware with the same strength and grade bolt.
- Check tightness of bolts periodically, using the tables below as a guide.
- Torque categories for bolts and cap screws are identified by their head markings.

5.2.1 SAE Bolt Torque Specifications

Torque values shown in this table are valid for non-greased, or non-oiled threads and heads. Therefore, do NOT grease or oil bolts or cap screws unless otherwise specified in this manual.

5.2.4 Flare-Type Hydraulic Fittings

1. Check flare (A) and flare seat (B) for defects that might cause leakage.

2. Align tube (C) with fitting (D) and thread nut (E) onto fitting without lubrication until contact has been made between the flared surfaces.

3. Torque the fitting nut (E) to the specified number of flats from finger tight (FFFT) or to a given torque value shown in the following table.

4. To prevent the fitting (D) from rotating, use two wrenches. Place one wrench on the fitting body (D) and tighten the nut (E) with the other wrench to the torque shown.

5. Assess the final condition of the connection.

19. Torque values shown are based on lubricated connections as in reassembly.
5.2.5 O-Ring Boss (ORB) Hydraulic Fittings (Adjustable)

1. Inspect O-ring (A) and seat (B) for dirt or obvious defects.
2. Back off the lock nut (C) as far as possible. Ensure that washer (D) is not loose and is pushed toward the lock nut (C) as far as possible.
3. Check that O-ring (A) is **NOT** on the threads, adjust if necessary.
4. Apply hydraulic system oil to the O-ring (A).

5. Install fitting (B) into port until back up washer (D) and O-ring (A) contacts on part face (E).
6. Position angle fittings by unscrewing no more than one turn.
7. Turn lock nut (C) down to washer (D) and tighten to torque shown. Use two wrenches, one on the fitting (B) and the other on the lock nut (C).
8. Check the final condition of the fitting.

[^1]: The values in the table represent the recommended torque range for tightening various thread sizes. The units are in foot-pounds (ft·lbf) and Newton-meters (N·m).
5.2.6 O-Ring Boss (ORB) Hydraulic Fittings (Non-Adjustable)

1. Inspect O-ring (A) and seat (B) for dirt or obvious defects.
2. Check that O-ring (A) is **NOT** on the threads, adjust if necessary.
3. Apply hydraulic system oil to the O-ring.
4. Install fitting (C) into port until fitting is hand tight.
5. Torque fitting (C) per value in chart. Refer to Table 5.12 O-Ring Boss (ORB) Hydraulic Fittings (Non-Adjustable), page 195.
6. Check the final condition of the fitting.

$^{21}$ Torque values shown are based on lubricated connections as in reassembly.
5.2.7 O-Ring Face Seal (ORFS) Hydraulic Fittings

To tighten O-ring face seal (ORFS) hydraulic fittings, follow these steps:

1. Check components to ensure that the sealing surfaces and fitting threads are free of burrs, nicks, and scratches or any foreign material.

2. Apply hydraulic system oil to the O-ring (B).

3. Align the tube or hose assembly so that the flat face of the sleeve (A) or (C) comes in full contact with O-ring (B).

4. Thread tube or hose nut (D) until hand-tight. The nut should turn freely until it is bottomed out.

5. Torque fitting further to the torque value in the table shown in the opposite column.

**NOTE:**
If applicable, hold the hex on the fitting body (E) to prevent rotation of fitting body and hose when tightening the fitting nut (D).

6. When assembling unions or two hoses together, three wrenches will be required.

7. Check the final condition of the fitting.

23. O-ring face seal type end not defined for this tube size.
5.3 Maintenance Specifications

5.3.1 Recommended Fuel, Fluids, and Lubricants

Storing Lubricants and Fluids

Your machine can operate at top efficiency only if clean fuel and lubricants are used.

- Use clean containers to handle all fuels and lubricants.
- Store in an area protected from dust, moisture, and other contaminants.
- Buy good quality, clean fuel from a reputable dealer.
- Avoid storing fuel over long periods of time. If you have a slow turnover of fuel in windrower tank or supply tank, add fuel conditioner to avoid condensation problems.
- Store fuel in a convenient place away from buildings.

Fuel Specifications

Use good quality diesel fuel from a reputable supplier. For most year-round service, No. 2 diesel fuel meeting ASTM specification D975 Grade S15 will provide good performance.

If the vehicle is exposed to extreme cold (below 20°F [-7°C]), or is required to operate at colder-than-normal conditions for prolonged periods, use climatized No. 2 diesel fuel, or dilute the No. 2 fuel with 50% No. 1 fuel. This will provide better protection from fuel gelling or wax-plugging of the fuel filters.

Table 5.14 Fuel Specification

<table>
<thead>
<tr>

<td>45–55° Cold Weather / High Altitude</td>
<td>460 Microns</td>
</tr>
</tbody>
</table>

In extreme situations, when available fuels are of poor quality or problems exist which are peculiar to certain operations, additives can be used. However, the engine manufacturer recommends consultation with the fuel supplier or engine manufacturer before using fuel additives. Situations where additives are useful include:

- A cetane improver additive can be used with low cetane fuels.
- A wax crystal modifier can help with fuels with high cold filter plugging points (CFPP).
- An anti-icer can help prevent ice formation in wet fuel during cold weather.
- An anti-oxidant or storage stability additive can help with fuel system deposits and poor storage stability.
- A lubricity enhancer can be used to increase the lubricity of fuels so that they meet the requirements given in the table on the previous page. Diesel fuel conditioner is available from your Dealer.

Diesel fuel conditioner is available from your Dealer. Refer to your engine manual for further information on fuel recommendations.

<sup>24</sup> Optional when operating temperature below 0°C (32°F).
### Lubricants, Fluids, and System Capacities

---

25. Optional when operating temperature is below 0°C (32°F).
26. SAE 85W-140 API Service Class GL-5. Extreme Pressure Gear Lubricant is used before initial change.
27. Equal parts with water, high quality, soft, de-ionized or distilled water as recommended by supplier.
28. Includes filter
29. For prior models who have not upgraded to 5 lbs of refrigerant order Kit MD #183180, which includes high pressure switch and decal to advise of systems 5 lbs charge requirement. Refer to Service Bulletin 1254.
30. New compressor (MD #203013) comes filled. If installing on 2014 and prior, refer to Service Bulletin 1254.
If Fleetguard ES Compleat® is unavailable, use a coolant concentrate or prediluted coolant intended for use with heavy duty diesel engines and with a minimum of the following chemical and physical properties:

- Is formulated with a quality nitrite free additive package.
- Provides cylinder cavitation protection according to fleet study run at or above 60% load capacity.
- Protects the cooling system metals (cast iron, aluminum alloys, and copper alloys such as brass) from corrosion.

The additive package must be part of one of the following coolant mixtures:

- Ethylene glycol or propylene glycol base prediluted (40–60%) heavy duty coolant.
- Ethylene glycol or propylene glycol base heavy duty coolant concentrate in a 40–60% mixture of concentrate with quality water.

Water quality is important to the performance of the cooling system. Distilled, deionized, or demineralized water is recommended for mixing with ethylene glycol and propylene glycol base engine coolant concentrate.

**IMPORTANT:**

Do **NOT** use cooling system sealing additives or antifreeze that contains sealing additives. Do **NOT** mix ethylene glycol and propylene glycol base coolants. Do **NOT** use coolants that contain nitrates.

5.4 Engine Compartment Hood

The engine hood has two open positions. The lowest is for general maintenance such as checking and adding fluid, servicing the cooling box, etc. The highest position accommodates full access to the engine bay.

5.4.1 Opening Hood (Lower Position)

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Stop the engine and remove the key.
2. Locate latch (A) behind grill and lift to release hood.
3. Raise hood until strap (B), which should be looped under hooks (C) and (D), stops it at approximately a 40° angle.
4. Remove strap from hook (C) and allow hood to raise slightly further.

Figure 5.16: Accessing Engine Compartment
5.4.2  Closing Hood (Lower Position)

1. Grasp the strap at (B) and loop under upper hook (C).

IMPORTANT:
Failure to hook strap may result in it becoming entangled with the screen cleaners or the latch

2. Pull down on strap (B), grasp the hood when within reach and lower until hood engages latch (A).

5.4.3  Opening Hood (Highest Position)

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Stop the engine and remove the key.
2. Locate latch (A) behind grill and lift to release hood.
3. Raise hood until strap (B) (which should be looped under hooks [C] and [(D)]) stops it at approximately a 40° angle.
4. Remove strap from hook (C) and allow hood to raise slightly further.
5. Remove strap from hook (D) and allow hood to raise fully to approximately 65°.

5.4.4 Closing Hood (Highest Position)

1. Pull down on strap (B) and loop under lower hook (D).
2. Grasp the strap and loop under upper hook (C).

**IMPORTANT:**
Failure to hook strap may result in it becoming entangled with the screen cleaners or the latch.

3. Pull down on strap, grasp the hood when within reach, and lower until hood engages latch (A).
5.5 Maintenance Platform

A swingaway platform/stair is provided for access to the operator’s station and engine bay maintenance. The maintenance platform has two positions:

- Standard Position
- Major Service Position

5.5.1 Opening Platform (Standard Position)

⚠️ CAUTION

Do NOT stand on the platform in the unlocked position. It is unstable and may result in a fall.

1. Approach the platform/stair unit (A) on the LH side of the windrower.
   
2. Push latch (A) and pull platform (B) toward walking beam until it stops and latch engages in open position.
5.5.2 Closing Platform (Standard Position)

⚠️ CAUTION

Do NOT stand on the platform in the unlocked position. It is unstable and may result in a fall.

This procedure describes how to close the platform (A).

1. If platform is latched in the open position, push latch (A) to unlock it.
2. Grasp handle (B) on platform and push forward until it stops and latch (A) engages.

Figure 5.22: Platforms

Figure 5.23: Platform Latch
5.5.3 Opening Platform (Major Service Position)

To improve access to the hydraulics plumbing or battery, the platform can be swung away from the windrower.

⚠️ CAUTION

Do NOT stand on the platform in the unlocked position. It is unstable and may result in a fall.

1. Open the hood. Refer to 5.4.1 Opening Hood (Lower Position), page 202.

**IMPORTANT:**
Failure to open hood will result in damage to the hood when the platform is moved.

2. Approach the platform/stair unit (A) on the LH side of the windrower.

3. Unlock latch (A) and move platform (B) toward open position. Do **NOT** lock in full aft position.

---

Figure 5.24: Platforms

Figure 5.25: Platform Latch
4. Remove the nut and bolt that secures the link (A) to the frame. Swing link (A) out of the way.

5. Pull the front (cab-forward) end of platform away from frame while moving it towards the walking beam. Aft corner (B) of platform should project slightly into engine bay when optimum opening is reached.

5.5.4 Closing Platform (Major Service Position)

⚠️ CAUTION

Do NOT stand on the platform in the unlocked position. It is unstable and may result in a fall.

1. Swing link (A) all the way forward.

2. Push the front (cab-forward) end of platform towards the frame while moving the platform forward (cab-forward).

3. Position link (A) on bracket and install bolt and nut. Tighten enough so that link can still swivel on bracket.

4. Move platform (B) forward (cab-forward) until it stops and latch (A) engages.

5. Close the hood. Refer to 5.4.2 Closing Hood (Lower Position), page 203.
5.6 Windrower Lubrication

**WARNING**

To avoid personal injury, before servicing windrower or opening drive covers, follow procedures in the SAFETY section.

The greasing points are marked on the machine by decals showing a grease gun and grease interval in hours of operation.

Log hours of operation and use the Maintenance Checklist provided to keep a record of scheduled maintenance. Refer to *Maintenance Schedule/Record, page 315*.

![Lubrication Interval Decal](image)

**Figure 5.29: Lubrication Interval Decal**

5.6.1 Lubricating the Windrower

**DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. To avoid injecting dirt and grit, wipe grease fitting with a clean cloth before greasing.

2. Inject grease through fitting with grease gun until grease overflows fitting, except where noted. Refer to *Lubricants, Fluids, and System Capacities, page 199*.

3. Leave excess grease on fitting to keep out dirt.

4. Replace any loose or broken fittings immediately.

5. If fitting will **NOT** take grease, remove and clean thoroughly. Also clean lubricant passageway. Replace fitting if necessary.
5.6.2 Lubrication Points

Refer to the following illustrations to identify various locations that require lubrication.

Figure 5.30: Lubrication Points
A - Forked Caster Wheel Bearing (2 Places) (Outer—Both Wheels)
C - Top Link (2 Places) (Both Sides)
D - Lubrication Decal (MD #183411)
B - Forked/formed Caster Wheel Bearing (2 Places) (Inner—Both Wheels) (50 Hrs/250 Hrs)
E - Caster Pivot (Both Sides)
5.7 Operator’s Station

5.7.1 Seat Belts

- Keep sharp edges and items that can cause damage away from the belts.
- From time to time, check belts, buckles, retractors, tethers, slack take-up system and mounting bolts for damage.
- Replace all parts that have damage or wear.
- Replace belts that have cuts that can weaken the belt.
- Check that bolts are tight on the seat bracket or mounting.
- Keep seat belts clean and dry. Clean only with a soap solution and warm water. Do NOT use bleach or dye on the belts, as this may weaken the material.

5.7.2 Safety Systems

Perform the following checks on the operator’s presence and engine lock-out systems annually or every 500 hours—whichever occurs first.

Checking Operator Presence System

1. While the windrower engine running, place the ground speed lever (GSL) in NEUTRAL and turn the steering wheel until it locks.
2. With everyone clear of the machine, engage header drive switch:
   a. After header drives are running, stand up out of the seat. In approximately 5 seconds, the header should shut off.
   b. If NOT, the Operator Presence System requires adjustment. See your MacDon Dealer.
3. With the windrower moving at less than 5 mph (8 km/h):
   a. Stand up out of the seat.
   b. The cab display module (CDM) will flash "NO OPERATOR" on the upper line and "ENGINE SHUT DOWN 5…4…3…2…1…0" on the lower line accompanied by a steady tone. At "0", the engine shuts down.
   c. If the engine does NOT shut down, the Operator Presence System requires adjustment. See your MacDon Dealer.
4. With the windrower moving at more than 5 mph (8 km/h):
   a. Stand up out of the seat.
   b. The CDM should beep once and display "NO OPERATOR" on the lower line.
   c. If NOT, the Operator Presence System requires adjustment. See your MacDon Dealer.
MAINTENANCE AND SERVICING

Checking Engine Interlock

1. With the engine shut down and the header drive switch engaged, try to start the engine. If the engine turns over, the system requires adjustment. See your MacDon Dealer.

2. With the engine shut down, steering wheel NOT centered, and the ground speed lever (GSL) in NEUTRAL, but NOT in N-DETENT, try to start the engine. The cab display module (CDM) will flash “NOT IN NEUTRAL” on the display upper line and “CENTER STEERING WHEEL” on the lower line, accompanied by a short beep with each flash and the engine should NOT turn over. If the engine turns over, the system requires adjustment. See your MacDon Dealer.

A properly functioning system should operate as follows. If not, see your MacDon Dealer.

- The starter should engage ONLY when the GSL is in N-DETENT, steering wheel locked in the CENTER position and the header drive switch is in the OFF position.
- Under the above conditions, the brake should engage and the machine should NOT move after engine start-up.
- The steering wheel should NOT lock with the engine running and the GSL is out of the N-DETENT.
- The machine should NOT move with the engine running and with the steering wheel still centered, when the GSL is pulled straight out of N-DETENT (NOT in forward or reverse).

5.7.3 Ground Speed Lever (GSL) Adjustments

Adjusting Ground Speed Lever (GSL) Lateral Movement

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

The ground speed lever (GSL) (A) should easily move into the N-DETENT (B) by itself.
The tensioner cable (A) should be tight when the GSL is at the right-hand side of the N-DETENT.

The NEUTRAL START switch should also be fully compressed. If the cable is too tight, it will prevent the NEUTRAL START switch from fully compressing, and prevent proper engagement of the pintle arm. Refer to 5.7.5 Neutral Start Switch, page 217.

Adjust the cable tension as follows:
1. Hold nut (B) from turning and loosen jam nut (C).
2. To increase the tension, turn the nut (B) clockwise.
3. To decrease the cable tension, turn the nut (B) counterclockwise.
4. Hold nut (B) from turning and tighten jam nut (C).

Adjusting Ground Speed Lever (GSL) Fore-Aft Movement

The GSL should remain as positioned by the Operator yet be movable without excessive force. The spring (C) is set at the factory to 2-1/2 in. (64 mm). If necessary, adjust as follows:
1. Hold nut (A) from turning, and loosen jam nut (B).
2. To increase the pivot resistance, turn the nut (A) clockwise to compress the spring.
3. To decrease the resistance, turn the nut (A) counterclockwise to release the spring tension.
4. Hold nut (A) from turning, and tighten jam nut (B).

Adjusting Ground Speed Lever (GSL) Position

The GSL (A) should be centered fore-aft in the N-DETENT slot (B) when the steering wheel is centered and locked.

If necessary, adjust GSL position as follows:

IMPORTANT:
Neutral Interlock must be properly adjusted before adjusting GSL position.
1. Loosen nuts (A)
2. Hold GSL in center of N-DETENT slot to locate support (B).
3. Tighten nuts (A, and torque to 80–90 lbf-ft (108–122 Nm).

5.7.4 Steering Adjustments

Checking Steering Link Pivots

The following checks should be performed annually:

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Place ground speed lever (GSL) (A) in N-DETENT, shut down engine, and remove key.
2. Beneath the cab, check for evidence of interference of moving parts with hoses, tubes, and other linkages.

3. Check steering rod bolts (A) for looseness and ball joints (B) for any perceptible play or movement.
4. If steering rod bolts are loose:
   a. Back off outer jam nut (A).
   b. Tighten inside nut (B) to 70–80 ft·lb (95–108 N·m).
   c. Hold inside nut (B) and tighten jam nut (A) to 60–70 ft·lb (81–95 N·m).

5. If steering rod ball joints (A) are loose, they should be replaced. See your MacDon Dealer.

6. Check steering link bolts (A) for looseness, and ball joint (B) for any perceptible play or movement.
7. If steering link bolts (A) are loose:
   a. Back off outer jam nut (B).
   b. Tighten inside nut (C) to 5–10 lbf-ft (7–13 N·m).
   c. Hold inside nut (C), and tighten jam nut (B) to 60–70 lbf-ft (81–95 N·m).

8. If steering link ball joints (D) are loose, they should be replaced. Contact your MacDon Dealer for replacement procedures.

9. After replacing parts or making adjustments, perform checks for Neutral Interlock and steering lock. Refer to 5.7.2 Safety Systems, page 211.

5.7.5 Neutral Start Switch

The NEUTRAL START Switch (A) is located on the frame adjacent to the hydrostatic transmission, and it must be closed before the engine can be started.

The switch is closed when the Neutral Interlock on the pump is activated by positioning the Ground Speed Lever (GSL) into N-DETENT, and locking the steering wheel in CENTER position.

When the switch closes, and the machine starts and runs, the brakes continue to be applied to the drive wheels as park brake solenoid is energized preventing brake release.

1. Check that electrical connections are good at NEUTRAL START Switch (A).

2. Check that the plunger of switch is fully compressed when the steering is locked, and the GSL is fully in N-DETENT. Adjust switch support if required as follows:
   a. Loosen nut (B), and adjust support (C) as required.
   b. Tighten nut (B).

**IMPORTANT:**
Do NOT over-adjust switch support, as this will prevent pintle arms from locking.
5.7.6 Heating, Ventilating, and Air Conditioning (HVAC) System

Fresh Air Intake Filter

The fresh air filter is located under the cab roof, behind the rear window, and should be serviced daily.

Servicing Fresh Air Intake Filter

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Loosen knob (B), and slide retainer out to release filter (A) from rear of cab roof.
2. Tap filter gently on a flat surface, dirty side down. Do **NOT** tap on a tire, treads may damage filter pleats.

3. Direct compressed air (100 psi [700 kPa] maximum) through filter in opposite direction of air flow arrows.

4. Wash filter as required:
   a. Soak 15 minutes in warm water (**NOT** over 100°F [40°C]) with Filter Element Cleaner (Donaldson D 1400 or equivalent).
   b. Rinse thoroughly with clean water (maximum pressure 40 psi [275 kPa]).
   c. Shake excessive water from filter, and allow element to dry. Do **NOT** use compressed air to dry filter as it may rupture the wet element. Protect element from freezing until dry.

5. Inspect filter before installing as follows:
   a. Hold a bright light on one side element, and check carefully for holes. Discard any element which shows the slightest hole.
   b. Be sure outer screen is not dented. Vibration would quickly wear a hole in the filter.
   c. Be sure filter gasket is in good condition. If gasket is damaged or missing, replace element.

6. Reinstall filter, making sure air flow arrows point towards cab.

*Return Air Cleaner/Filter*

The return air cleaner/filter is located behind the operator’s seat on the cab wall and should be serviced every 100 hours.

*Removing and Installing Return Air Filter/Cleaner*

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.
MAINTENANCE AND SERVICING

1. Unscrew the two knobs (A) attaching cover and filter to cab wall, and remove the cover and filter assembly (B).

2. Separate the filter (B) from the cover (A).

3. Clean or replace filter. If cleaning filter, refer to Cleaning Return Air Cleaner, page 220.

4. Assemble the cleaner (B) and cover (A), and position on cab wall over opening.

5. Secure filter assembly (B) to cab wall with knobs (A).

Cleaning Return Air Cleaner

Clean the electrostatic filter as follows:
1. Mix a solution of warm water and detergent in a suitable container so that the filter (B) can soak for a few minutes.

2. Agitate to flush out the dirt.

3. Rinse with clean water, and then dry with compressed air.

4. Inspect filter for damage, separation, and holes. Replace if damaged.

Air Conditioning Condenser

The air conditioning condenser should be cleaned daily with compressed air. More frequent cleaning may be necessary in severe conditions.

Cleaning the condenser can be done at the same time as the radiator, oil cooler, and charge air cooler. Refer to Maintaining Engine Cooling Box, page 250.
Air Conditioning Evaporator

The air conditioning evaporator should be checked annually for cleanliness. If the air conditioning system produces insufficient cooling, a possible cause is clogged evaporator fins. Fins will clog up from the side opposite the blowers. The evaporator is located inside the heating air conditioning unit under the cab. It is accessed by removing the cover from the unit.

Removing Air Conditioning Cover

DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Loosen the clamps (A) on the two drain hoses and pull the hoses off the air conditioning drain tubes.

2. Remove the ten fasteners (A) that attach the cover to the housing. Remove the cover.

Figure 5.51: HVAC System

Figure 5.52: HVAC System
Cleaning Air Conditioning Evaporator Core

⚠️ WARNING

To avoid cuts from evaporator fins, do NOT use bare hands to brush away clogs.

1. Use a vacuum or compressed air to remove dirt from inside the unit.
2. Blow compressed air through the evaporator fins from the blower side (A) first as shown. Direct the air straight into the evaporator to prevent fin damage. A nozzle extension would make this procedure easier.
3. Repeat the previous step from the side opposite the blowers (B).
4. If dirt is still present, soak evaporator in water to loosen dirt and then blow out with compressed air.

![Figure 5.53: HVAC System](image1)

Installing Air Conditioning Cover

1. Straighten any bent fins.
2. Position cover and attach with ten fasteners (A).

![Figure 5.54: HVAC System](image2)
3. Reattach drain hoses to drain tubes and secure with hose clamps (A).

![HVAC System](image)

**Figure 5.55: HVAC System**

**Air Conditioning (A/C) Compressor**

The compressor is protected from excessively low suction and high discharge pressures by two switches that shut down the compressor to prevent damage to the system. These switches do not require any regular servicing or maintenance, so if problems occur and the switches are suspect, contact your MacDon Dealer.

- The low pressure switch is normally closed with an A/C charge in the system. It is located at the outlet of the evaporator (under cab in A/C box). It will open when the pressure falls to 2–8 psi (14–55 kPa) and close when pressure rises above 15–25 psi (103–172 kPa).

- The high pressure switch is normally closed with an A/C charge in the system and is located on the receiver drier (right-hand frame rail, behind back of fuse panel). It opens if pressure exceeds 360–380 psi (2482–2620 kPa) on rising pressure. It will close when pressure falls below 220–280 psi (1517–1931 kPa) on falling pressure.

If the compressor cycles rapidly due to rapid pressure changes, the cab display module (CDM) displays a warning “CHECK A/C SYSTEM”. Contact your Dealer.
Figure 5.56: HVAC System
A - Expansion Valve  B - Low Pressure Switch   C - Electrical Connector  
E - Thermostat     F - Evaporator Core       G - A/C Relays       H - Blower Motor
I - Blower Fans    J - High Pressure Switch  K - Receiver Dryer   L - Heater Valve (Not Shown)

Servicing the Air Conditioning Compressor

Refer to Replacing Air Conditioner A/C Compressor Belt, page 257 for belt replacement procedure.

See your MacDon Dealer for all other servicing procedures.

5.7.7 Engine

⚠️ CAUTION

- NEVER operate engine in a closed building. Proper ventilation is required to avoid exhaust gas hazards.
- Keep the engine clean. Straw and chaff on a hot engine are a fire hazard.
- NEVER use gasoline, naphtha, or any other volatile material for cleaning purposes. These materials are toxic and/or flammable.

General Engine Inspection

Engine inspection should be performed by your MacDon Dealer.

Refer to your engine manual for further information. (Owner’s Manual QSB 4.5 and QSB 6.7 Engine Cummins #4021531 are supplied with your machine).
Turning Engine Manually

To manually turn the engine with the flywheel, an access hole is provided on the left cab-forward side for a barring tool that is available from Cummins.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

**IMPORTANT:**
Ensure nothing falls into gearbox oil reservoir.

1. Stop engine and remove ignition key.
2. Open the hood to the lowest position, refer to 5.4.1 Opening Hood (Lower Position), page 202.
3. Remove positive (red) cables (A, C) from battery posts first, then remove negative (black) cables (B, D) from both battery posts.

4. Clean area around the plastic cap on access hole (A). Remove the cap.
5. Insert the barring tool (B) into the flywheel housing until it engages the ring gear.
6. Attach a 1/2 in. square drive ratchet or breaker bar, and turn.
7. Remove barring tool (B) and clean oil from around access hole.
8. Clean plastic cap and reinstall in access hole (A) with silicone sealant.
MAINTENANCE AND SERVICING

IMPORTANT:
BATTERY IS NEGATIVE GROUNDED. Always connect starter cable to the positive (+) terminal of battery and battery ground cable to negative (-) terminal of battery. Reversed polarity in battery or alternator may result in permanent damage to electrical system.

9. Attach negative (black) cables (B, D) to negative posts on batteries, and tighten clamps. Then attach positive (red) cables (A, C) to positive post on batteries and tighten clamps.

11. Close the hood, refer to 5.4.2 Closing Hood (Lower Position), page 203.

Engine Oil

Checking Engine Oil Level

Check engine oil level frequently and watch for any signs of leakage.

To check the engine oil level, follow these steps:

NOTE:
During the break-in period, a higher than usual oil consumption should be considered normal.

1. Open the hood to the lowest position. Refer to 5.4.1 Opening Hood (Lower Position), page 202.

2. Operate the engine at low idle, and check for leaks at the filter and drain plug.

3. Stop the engine and remove the key. Wait about 5 minutes.

4. Remove dipstick (A) by turning it counterclockwise to unlock.

5. Wipe clean, reinsert in engine, and then remove.
6. Oil level should be between LOW and HIGH. If level is below LOW mark, 2 US quarts (1.9 liters) will raise the level from LOW to HIGH.

**NOTE:**
If you need to add oil, refer to *Adding Engine Oil, page 229.*

7. Replace dipstick and turn it clockwise to lock.

8. Close the hood. Refer to **5.4.4 Closing Hood (Highest Position), page 204.**

---

**Changing Engine Oil**

Refer to the following procedures:

- *Checking Engine Oil Level, page 227*
- *Draining Engine Oil, page 228*
- *Replacing Engine Oil Filter, page 229*
- *Adding Engine Oil, page 229*

**Draining Engine Oil**

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

**NOTE:**
The engine should be warm prior to changing the oil.

1. Stop the engine and remove the key.

2. Place a drain pan with a capacity of about 6 US gallons (24 liters) under the engine oil drain.
3. Remove oil drain plug (A) and allow the oil to completely finish draining.

4. Replace drain plug (A).

5. Check the condition of the used oil. If either of the following is evident, have your Dealer correct the problem before starting the engine:
   • Thin black oil indicates fuel dilution.
   • Milky discoloration indicates coolant dilution.

6. Properly dispose of used oil.

Replacing Engine Oil Filter

NOTE:
Replace oil filter each time engine oil is changed.

1. Open the hood. Refer to 5.4.1 Opening Hood (Lower Position), page 202.

2. Clean around the filter head (A).

3. Remove filter.

4. Clean gasket mating surface.

5. Apply a thin film of clean oil to the gasket on the new filter. Refer to Filter Part Numbers, page 200 for recommended oil filter to use.

6. Screw the new filter onto the filter mount until the gasket contacts the filter head.

7. Tighten the filter an additional 1/2 to 3/4 turn by hand.

IMPORTANT:
Do NOT use a filter wrench to install the oil filter. Overtightening can damage the gasket and filter.

8. Properly dispose used oil filter.

Adding Engine Oil

1. Stop the engine and remove the key. Wait about 5 minutes.

2. Open the hood. Refer to 5.4.1 Opening Hood (Lower Position), page 202.
3. Remove filler cap (A) by turning it counterclockwise.

4. Carefully pour the oil. A funnel is recommended to avoid spillage. Refer to *Lubricants, Fluids, and System Capacities, page 199* for oil specifications.

**CAUTION**

Do NOT fill above the HIGH mark.

5. Replace oil filler cap (A) and turn it clockwise until snug.

6. Check the oil level. Refer to *Checking Engine Oil Level, page 227*.

7. Close the hood. Refer to *5.4.2 Closing Hood (Lower Position), page 203*.

*Air Intake System*

**IMPORTANT:**

Do NOT run engine with air cleaner disconnected or disassembled.

Engine intake air is drawn through a duct (A) from the cooling box that precleans the air and then through a dual element filter (B).

The air cleaner canister is equipped with an aspirator (C) that removes dust continuously from the air cleaner housing.

The air cleaner is also equipped with an air filter restriction switch (D) that indicates when the primary filter element requires cleaning.

Refer to *Filter Part Numbers, page 200*.

**IMPORTANT:**

- Do NOT run engine with air cleaner disconnected or disassembled.

- Over-servicing the filter element increases the risk of dirt being ingested by the engine and severely damaging the engine.

- Filter servicing should only be performed when the CDM indicates “ENGINE AIR FILTER” or at the specified interval. Refer to *Maintenance Schedule/Record, page 315*. 

Figure 5.64: Oil Filler Cap

Figure 5.65: Air Intake System
Air Filter Restriction Indicator

During engine operation, the indicator shows the vacuum in inches of H2O and kPa. As dirt accumulates in the filter, the restriction increases.

When indicator gauge (A) shows a restriction of 25 inches of H2O (6.20 kPa) and window (B) shows red, the filter requires servicing.

**IMPORTANT:**
Over-servicing the filter element increases the risk of dirt being ingested by the engine, and severely damaging the engine.

Service air filter **ONLY IF** indicator (A) reads 25 inches H2O (6.20 kPa) and/or indicator (B) shows red.

**IMPORTANT:**
After servicing filters, press button (C) to reset the gauge and clear the red indicator from window (B).

Removing Primary Air Filter

1. Open the hood, refer to 5.4.1 Opening Hood (Lower Position), page 202.
2. Slightly lift catch (A) at side of end cap (B) and rotate end cap counterclockwise until it stops.

3. Make sure arrow (A) lines up with UNLOCK symbol on end cap.
4. Pull off the end cap.
5. Check the aspirator duct opening (A) for obstructions or damage. Clean if necessary.

6. Pull out the primary filter element (A).

IMPORTANT:
Be extremely careful with the dirty element, until you get it completely out of the housing. Accidentally bumping it while still inside means dropped dirt and dust may contaminate the clean side of your filter housing, before the new filter element has a chance to do its job.

Replace the secondary air filter (A) every year or after every third primary filter change (even if it appears clean).

If you’re changing the secondary air filter because it is dirty, inspect the primary filter and the filter canister to determine the reason for contamination.

- Examine the filter canister for cracks and replace if necessary.
- Ensure filter sealing surfaces are soft, flexible, and sealing properly. Hard seals may allow debris through to the secondary filter.
- Ensure canister retaining latches are secure.

IMPORTANT:
- Do NOT remove the secondary filter element unless it needs replacing.
- Do NOT attempt to clean the secondary element (A). Replace only.
7. Clean the inside of the canister housing and end cap carefully. Dirt left in the air cleaner housing may be harmful to your engine.
   - Remove hardened dirt ridges wherever filter gaskets contact the cleaner housing.
   - Clean the gasket sealing surfaces of the housing. An improper gasket seal is one of the most common causes of engine contamination.
   - Wipe every surface clean with a clean, water-dampened cloth.
   - Check it visually to make sure it is clean before putting in a new element.

8. Check for uneven dirt patterns on your old element. Your old element is a valuable clue to potential dust leakage or gasket sealing problems. A pattern on the element clean side is a sign that the old element was NOT firmly sealed or that a dust leak exists.
   - Press on the fresh gasket to see if it springs back.
   - Check the gasket for correct sizing. On a radial seal element the gasket surface is the inside diameter of the open end cap.
   - Make sure the gasket is seating evenly. If the gasket is not forming a perfect seal, you will NOT have protection.
   - Ensure the sealing surface in the housing is clean, and the filter element is the correct model number. It may be too short for the housing.
   - Identify and rectify the cause of any leaks before replacing the filter element.

9. If required, also change the secondary filter. Refer to Removing and Installing Secondary Air Filter, page 236.

Installing Primary Air Filter

NOTE:
If replacing air filter, refer to Filter Part Numbers, page 200.
MAINTENANCE AND SERVICING

1. Insert new primary filter element (A) into canister over secondary element, and push into place, ensuring that element is firmly seated in canister.

2. Align arrow (A) to UNLOCK position on end cap, and push end cap fully onto housing.

3. Rotate end cap clockwise until catch (A) engages housing to prevent end cap from turning.

4. Position end cap (B) onto filter housing with aspirator pointing approximately down.

5. Secure end cap onto filter housing by closing latch (A).
6. After servicing the filter, you must reset the restriction switch (A) by pushing the button on the end of it to reset it.

7. Close the hood, refer to 5.4.2 Closing Hood (Lower Position), page 203.

Cleaning Engine Air Filter Primary Element

**IMPORTANT:**
The secondary (inner) element should NEVER be cleaned, only replaced.

**IMPORTANT:**
Air filter element cleaning is NOT recommended due to the possible degradation of the element material. If cleaning is performed, there are several risks involved and the following procedures should be followed. If any of the following conditions are found, the filter element MUST be replaced.

1. Hold a bright light inside element, and check carefully for holes.
2. Check outer screen for dents. Vibration would quickly wear a hole in the filter.
3. Check filter gasket for cracks, tears, or other signs of damage.
4. Check element for oil or soot contamination.
5. Check the secondary element for cleanliness. If there is visible dirt on the secondary element, replace both primary and secondary elements. Do **NOT** clean.

**IMPORTANT:**
The air cleaner’s primary (outer) filter element should be replaced after three cleanings or at the specified interval. The secondary (inner) element should be replaced every third time the primary element is changed. Refer to 5.7.11 Maintenance Schedule, page 313 for the required interval.

6. If secondary element passes inspection, clean primary element as follows:
   a. Use compressed air **NOT** exceeding 60 psi (400 kPa), and a Dry Element Cleaner Gun.
   b. Hold nozzle next to inner surface only, and move up and down on pleats.
   c. After three cleaning's (or at the specified interval), replace the primary element.
7. Repeat inspection before installing.
Removing and Installing Secondary Air Filter

Replace the secondary air filter (A) every year or after every third primary filter change (even if it appears clean).

If you’re changing the secondary air filter because it is dirty, inspect the primary filter and the filter canister to determine the reason for contamination.

- Examine the filter canister for cracks and replace if necessary.
- Ensure filter sealing surfaces are soft, flexible, and sealing properly. Hard seals may allow debris through to the secondary filter.
- Ensure canister retaining latches are secure.

NOTE:
- Do NOT remove the secondary filter element unless it needs replacing.
- Do NOT attempt to clean the secondary element (A). Replace only.

1. Remove the primary filter, refer to Removing Primary Air Filter, page 231.

IMPORTANT:
When replacing secondary filter, reinsert new filter as soon as possible to prevent dirt from entering engine intake.

2. Remove the secondary element (A), and pull it out of the canister.

NOTE:
If replacing filter, refer to Filter Part Numbers, page 200.

3. Insert new secondary filter element (A) into canister, seal first, and push until seal is seated inside canister.

4. Reinstall the primary filter, refer to Installing Primary Air Filter, page 233.
Fuel System

Removing and Installing Fuel Tank Vent Filter

The fuel tank is vented by a hose that is connected to the filler tube. The hose is connected to a filter that should be changed annually.

Change the filter as follows:

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

⚠️ WARNING

To avoid personal injury or death from explosion or fire, do NOT smoke or allow flame or sparks near windrower when servicing.

1. Stop the engine and remove the key.
2. Open the hood. Refer to 5.4.3 Opening Hood (Highest Position), page 203.
3. Open the left cab-forward side maintenance platform. Refer to 5.5.1 Opening Platform (Standard Position), page 205.
4. Locate filter (A) on vent line against hydraulic oil reservoir.
5. Release hose tension clamps (B) and slide away from filter. Pull hoses off filter.
6. Position new filter through hole in frame and attach top hose onto filter. IN marking should face down.

**NOTE:**

If filter has an arrow instead of an IN marking, arrow should point up.

7. Attach lower hose to filter and secure both hoses with tension clamps (B).
8. Close hood, refer to 5.4.4 Closing Hood (Highest Position), page 204.
Maintaining Fuel Filters

The windrower fuel system is equipped with primary (A) and secondary (B) screw-on cartridge type filters. The primary filter (A) is equipped with a separator that separates sediment and water from the fuel.

Change both filters every 500 hours of operation.

Refer to the following procedures:

- Removing Primary Fuel Filter, page 238
- Installing Primary Fuel Filter, page 239
- Removing Secondary Fuel Filter, page 240
- Installing Secondary Fuel Filter, page 240

Removing Primary Fuel Filter

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Stop the engine and remove the key.
2. Open the hood, refer to 5.4.3 Opening Hood (Highest Position), page 203.
3. On the bottom of the fuel tank, locate the fuel supply valve (A) and move it to the closed position.

4. Locate the primary fuel filter (A) on the right cab-forward side of the windrower.

**NOTE:**
Bottom part of the image made transparent to show location of the primary filter.

5. Clean around the primary filter (A) head.
6. Disconnect the water in fuel (WIF) sensor (B) from bottom of filter.
7. Turn drain valve (C) by hand counterclockwise until draining occurs, and drain filter into a container.
8. Remove filter (A) with a filter wrench.
9. Clean gasket mating surface.

**Installing Primary Fuel Filter**

**IMPORTANT:**
Do NOT prefill filter with fuel. Prefilling can contaminate the fuel system.
NOTE:
If replacing filter, refer to *Filter Part Numbers, page 200.*

1. Screw the new filter (A) onto the filter mount until the gasket contacts the filter head.
2. Reconnect water in fuel (WIF) sensor (B).
3. Tighten the filter an additional 1/2 to 3/4 turn by hand.

**IMPORTANT:**
Do **NOT** use a filter wrench to install the filter. Overtightening can damage the gasket and filter.

---

**Removing Secondary Fuel Filter**

1. Stop the engine and remove the key.
2. Open the hood, refer to *5.4.3 Opening Hood (Highest Position), page 203.*
3. Clean around the secondary filter head (A).
4. Place a container under the filter to catch spilled fluid.
5. Remove filter (B) with a filter wrench.
6. Clean gasket mating surface.

---

**Installing Secondary Fuel Filter**

**IMPORTANT:**
Do **NOT** prefill filter with fuel. Prefilling can contaminate the fuel system.

**NOTE:**
If replacing filter, refer to *Filter Part Numbers, page 200.*
1. Screw the new secondary filter (A) onto the filter mount until the gasket contacts the filter head.

2. Tighten the filter an additional 1/2 to 3/4 turn by hand.

**IMPORTANT:**
Do NOT use a filter wrench to install the filter. Overtightening can damage the gasket and filter.

3. Open fuel valve (A) under fuel tank.

4. Prime the fuel system, refer to *Priming Fuel System, page 244.*

---

### Draining Fuel Tank

Draining the fuel tank is necessary to remove old or contaminated fuel.

⚠️ **WARNING**

- To avoid personal injury or death from explosion or fire, do NOT smoke or allow flame or sparks near fuel tank when refueling.
- **NEVER** refuel the windrower when the engine is hot or running.

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Stop the engine and remove the key.

2. Open the hood, refer to *5.4.1 Opening Hood (Lower Position), page 202.*

4. Place a 5 U.S. gallon (20 liter) drain pan under the fuel supply hose (A) at primary filter.

5. Loosen clamp (B) and pull fuel supply hose (A) off fitting.

6. Route hose to drain pan and open valve (A) to drain tank.
7. Add some clean fuel to tank to flush out any remaining contaminants.
8. Reattach fuel supply hose (A) to fitting. Install clamp (B) and tighten.

**NOTE:**
Do **NOT** refill the fuel tank if you need to work on the system. Refill it once work is completed. Refer to *Filling Fuel Tank, page 92*.

**Fuel/Water Separator**

A fuel water separator is incorporated into the primary fuel filter. The separator is equipped with a drain and with a sensor that detects water in the fuel and alerts the Operator on the cab display module (CDM).

Refer to the following procedure to remove water from the fuel system:

**Removing Water from Fuel System**

Drain the water and sediment as follows from the separator daily, or at any time the cab display module (CDM) water in fuel (WIF) light illuminates.

1. Stop the engine and remove the key.
2. Open the hood, refer to *5.4.1 Opening Hood (Lower Position), page 202*.
3. Place a container under the filter (A) to catch spilled fluid.
4. Turn drain valve (C) by hand 1-1/2 to 2 turns counterclockwise until draining occurs.
5. Drain the filter sump of water and sediment until clear fuel is visible.
6. Turn the valve clockwise to close the drain.
7. Dispose of fluid safely.
8. Close the hood, refer to *5.4.2 Closing Hood (Lower Position), page 203.*
System Priming

Controlled venting of air is provided at the injection pump through the fuel drain manifold. Small amounts of air introduced by changing filters or injection pump supply line will be vented automatically, if the fuel filters are changed in accordance with instructions.

IMPORTANT:
Bleeding the fuel system is NOT recommended or required. Manual priming will be required if:

- Fuel filter is replaced.
- Injection pump is replaced.
- High-pressure fuel lines are replaced.
- Engine is run until fuel tank is empty.

Priming Fuel System

To prime the fuel system, follow these steps:

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

⚠️ WARNING

The fuel pump high-pressure fuel lines and fuel rail contain extremely high pressure fuel. Never loosen any fittings. Personal injury and property damage can result.

1. Stop the engine and remove the key.
2. Open the hood to lowest position. Refer to 5.4.1 Opening Hood (Lower Position), page 202.
3. Turn the priming knob (A) counterclockwise to unlock the plunger on the primary filter head.
4. Pump approximately 120 times to pressurize the fuel system.
5. Lock the plunger by turning knob (A) clockwise until snug.
6. Try starting engine. If engine does NOT start, repeat priming.
7. Close hood. Refer to 5.4.2 Closing Hood (Lower Position), page 203.
MAINTENANCE AND SERVICING

Engine Cooling System

The engine cooling system is designed to maintain the engine operating temperature within the specified operating range.

NOTE:
Antifreeze is essential in any climate. It broadens the operating temperature range by lowering the coolant freezing point, AND by raising its boiling point. Antifreeze also contains rust inhibitors and other additives to prolong engine life.

IMPORTANT:
If antifreeze strength is not adequate, do NOT drain cooling system to protect against freezing. System may not drain completely and damage from freezing could still result. Refer to Lubricants, Fluids, and System Capacities, page 199 for detailed information.

Inspecting Radiator Cap

The radiator cap must fit tightly and the cap gasket must be in good condition to maintain the 14–18 psi (97–124 kPa) pressure in the cooling system.

⚠️ CAUTION
To avoid personal injury from hot coolant, do NOT turn radiator cap until engine cools.

1. Open the hood. Refer to 5.4.3 Opening Hood (Highest Position), page 203.
2. Open the platform. Refer to 5.5.1 Opening Platform (Standard Position), page 205.
3. Turn the cap (A) counterclockwise to the first notch to relieve pressure before removing cap completely.
4. Turn the cap (A) again and remove.
5. Check the gasket for cracks or deterioration and replace the cap if necessary.
6. Check that the spring in the cap moves freely.
7. Replace the cap if spring is stuck.
8. Close the platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.
9. Close the hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.

Figure 5.93: Engine Cooling System

Checking Engine Coolant Strength

Check the anti-freeze in the radiator with a tester annually, preferably before off-season storage.

⚠️ CAUTION
To avoid personal injury from hot coolant, do NOT turn radiator cap until engine cools.
MAINTENANCE AND SERVICING

1. Open the hood. Refer to 5.4.3 Opening Hood (Highest Position), page 203.

2. Open the platform. Refer to 5.5.1 Opening Platform (Standard Position), page 205.

3. Remove the radiator cap (A).

IMPORTANT:
Turn the cap (A) counterclockwise to the first notch to relieve pressure before removing cap completely.

4. Check the coolant in the radiator using an antifreeze tester. Tester should indicate protection to temperatures of -30°F (-34°C).

5. Inspect the radiator cap before reinstalling, refer to Inspecting Radiator Cap, page 245.

6. Replace radiator cap (A).

7. Close the platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.

8. Close the hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.

Checking Coolant Level

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

Check coolant level in the coolant recovery tank daily.

1. Stop the engine and remove the key.

2. Open the hood. Refer to 5.4.3 Opening Hood (Highest Position), page 203.

3. Open the platform. Refer to 5.5.1 Opening Platform (Standard Position), page 205.

NOTE:
To view coolant capacities, refer to Lubricants, Fluids, and System Capacities, page 199.

4. Close the platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.

5. Close the hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.
Changing Coolant

Coolant should be drained and the system flushed and filled with new coolant every **2000 hours or 2 years**.

Refer to the following procedures:
- *Draining Coolant, page 247*.
- *Adding Coolant, page 249*.

**Draining Coolant**

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

⚠️ **CAUTION**

To avoid personal injury from hot coolant, do **NOT** turn radiator cap until engine cools.

1. Stop the engine, remove the key. Let the engine cool.
2. Open the hood. Refer to **5.4.3 Opening Hood (Highest Position), page 203**.
3. Open the platform. Refer to **5.5.1 Opening Platform (Standard Position), page 205**.
4. Turn the radiator cap (A) to the first notch to relieve pressure before removing cap completely.
5. Remove the radiator cap and open radiator drain valve (A) at the bottom of the engine side of the radiator lower tank.

**IMPORTANT:**
Place a drain pan (about 8 U.S. gallons [30 liters]) under the engine and radiator and use a deflector or hose to prevent coolant running onto frame.

6. Close the heater shut-off valve and disconnect hose on heater side of valve.

7. Open valve to drain the block.

8. When system is drained, reattach hose on valve.

9. Close radiator drain valve (A) at the bottom of the engine side of the radiator lower tank.

10. Fill system with clean water through the radiator and replace radiator cap.
11. Open heater shut-off valve.

12. Start engine and turn temperature control knob to HIGH. Run engine until normal operating temperature is reached.

13. Stop the engine and drain water out before rust or sediment settles. Repeat coolant removal procedure.

14. Close drain valves and fill system with a solution of clean water and a heavy duty radiator cleaner. Follow instructions provided with cleaner.

15. After using cleaner solution, again flush system with clean water. Inspect radiator, hoses, and fittings for leaks.

17. Close the platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.

18. Close the hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.

Adding Coolant

Check the coolant level in the coolant recovery tank (A) daily, the tank should be at least one-half full. If less, add coolant.

⚠️ CAUTION

To avoid personal injury from hot coolant, do NOT turn radiator cap until engine cools.

NOTE:
Do NOT add coolant to radiator except when changing coolant.

To add coolant to the coolant recovery tank, follow these steps:

1. Open the hood. Refer to 5.4.3 Opening Hood (Highest Position), page 203.

2. Open the platform. Refer to 5.5.1 Opening Platform (Standard Position), page 205.
3. Remove cap (B) and add coolant until one-half full.

**NOTE:**
For coolant specifications, refer to *Lubricants, Fluids, and System Capacities, page 199.*

4. Replace cap (B).

5. Close the platform. Refer to **5.5.2 Closing Platform (Standard Position), page 206**.

6. Close the hood. Refer to **5.4.4 Closing Hood (Highest Position), page 204**.

---

**Maintaining Engine Cooling Box**

Refer to the following procedures:

- **Opening Cooler Box Screen, page 250**
- **Cleaning Screens and Coolers, page 251**
- **Cleaning Cooler Box Components, page 252**
- **Adjusting Screen Cleaner Duct to Screen Clearance, page 254**
- **Closing Cooler Box Screen, page 255**

**Opening Cooler Box Screen**

1. Open the hood. Refer to **5.4.3 Opening Hood (Highest Position), page 203**.

2. Push latch (A) and open screen assembly access door (B). Secure with rod stored inside screen door.
Cleaning Screens and Coolers

The cooling box screen is equipped with an automatic cleaning device that vacuums the screen by means of two rotors. They only operate when the engine is running. The rotors are electrically driven and the suction is provided by the engine cooling fan. If the screen is not being cleaned by the rotors, they may be plugged.

If rotors are plugged, clean as follows:

1. Open the hood. Refer to 5.4.3 Opening Hood (Highest Position), page 203.
2. Remove nuts (B).
3. Pivot screen cleaner assembly (C) away from screen.
4. Blow out debris from ducts (A) with compressed air.
5. If ducts are plugged, open the cooler box screen. Refer to Opening Cooler Box Screen, page 250.
6. Blow debris out of ducts (A) with compressed air.
7. Clean screen with compressed air.
8. Move the screen cleaner assembly (C). Secure with bolts and nuts (B).

9. Close the cooler box screen. Refer to Closing Cooler Box Screen, page 255.

10. Close the hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.

Cleaning Cooler Box Components

The radiator and oil cooler should be cleaned daily with compressed air. More frequent cleaning may be necessary in severe conditions. The charge air cooler and air conditioning condenser may also be cleaned at the same time.

To clean these components, proceed as follows:

1. Open cooler box screen. Refer to Opening Cooler Box Screen, page 250.

2. Lift latch (A) and open the right hand access door (B).
3. Slide out the oil cooler / air conditioning condenser assembly (A).

4. Lift latch (A) and open the left hand access door (B).

5. Loosen wing nut (A) and open access door (B) at top of cooling box.

**NOTE:**
Fins on coolers can be very easily bent which may interfere with its function. Exercise caution when cleaning.
6. Clean radiator (D) through access holes in cooling box with compressed air.

7. Clean oil cooler / air conditioning condenser (A), charge air cooler (E), fuel cooler (B), and cooling box (C) with compressed air.

8. Inspect all lines and coolers for evidence of leaks and damage.

9. Slide oil cooler / air conditioning condenser (A) back into cooling box (C).

10. Close side access door and lock with lever.

11. Close access door on top of the cooling box and secure with wing nut.

Adjusting Screen Cleaner Duct to Screen Clearance

Check clearance between trailing edge of screen cleaner duct (A) and screen. It should be 3/64–5/16 in. (1–8 mm) at all locations when rotating.

NOTE:
Screen cleaner ducts rotate counterclockwise and may touch screen as long as it continues to rotate.

If necessary, adjust clearance as follows:

1. Open the hood. Refer to 5.4.1 Opening Hood (Lower Position), page 202.

2. Loosen nut (B) on motor support (C).

3. Move support in or out until duct is 3/32–1/4 in. (2–6 mm) from screen near the center.

4. Retighten nut (B).

5. Loosen the two motor mount bolts (D).

6. Move motor/duct assembly (E) to obtain 3/64–5/16 in. (1–8 mm) gap to screen at full rotation of the duct.

7. Retighten nuts (D) on motor mount.

8. Close the hood. Refer to 5.4.2 Closing Hood (Lower Position), page 203.
Closing Cooler Box Screen

1. Unhook the support rod and store it in the screen door. Close screen access door (B) and engage latch (A).

2. Close the hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.

Exhaust System

⚠️ CAUTION

Engine exhaust stack may be hot. To avoid burns, do NOT touch muffler when engine is running. Allow sufficient cooling time after shut-down.

The exhaust system requires no regular maintenance, but it should be inspected periodically as follows:

1. Open the hood to its highest position. For instructions, refer to 5.4.3 Opening Hood (Highest Position), page 203.

2. Inspect the area around clamps (A) for breakage, cracks and rust-through. In addition to excess noise, a leaky exhaust system may allow exhaust gases to escape to the cab.

3. Check tubing for dents or crushed areas. Dents or crushed portions of any tubing create exhaust flow restriction, and increase back pressure significantly. Even relatively small dents will cause decreased fuel economy and increased turbo wear. If dents are relatively large, increased bearing and cylinder wear will occur due to increased exhaust temperature.

4. Make sure the exhaust system is secured to eliminate vibration. The brackets (B) should fit securely to the muffler (C), and to the engine.

IMPORTANT:

Do NOT change muffler type, piping sizes, or exhaust configuration. See your Dealer for proper replacement parts.
MAINTENANCE AND SERVICING

Belts

Tensioning Alternator/Fan Belt

The alternator, water pump, and fan belt are automatically tightened; manual adjustment is NOT required.

Replacing Fan Belt

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Shut down the engine and remove the key.
2. Open the LH platform. Refer to 5.5.1 Opening Platform (Standard Position), page 205.
3. Open the hood. Refer to 5.4.1 Opening Hood (Lower Position), page 202.
4. Loosen compressor mounting hardware (B) and push compressor towards engine to release tension.
5. Remove belt (A) from compressor.
6. Insert the drive end of a 1/2 in. drive ratchet wrench into the belt tensioner (B).
7. Rotate tensioner counterclockwise until fan belt (C) can be slipped off pulley (D). Release tensioner and remove wrench.
8. Remove belt in order 1–2–3 as shown. Route fan belt around fan and remove belt.
9. Install new belt (C) around fan and onto pulleys in order 3–2–1.
10. Insert the drive end of a 1/2 in. drive ratchet wrench into the belt tensioner (C).
11. Rotate tensioner counterclockwise until belt (C) can be slipped onto pulley (D). Release tensioner and remove wrench.
12. Check that belt is properly seated in all pulley grooves.

Figure 5.114: A/C Compressor

Figure 5.115: Engine Belts
A - A/C Compressor Belt
B - Belt Tensioner
C - Fan Belt
D - Pulley
MAINTENANCE AND SERVICING

13. Install new compressor belt (A).
14. Pry compressor away from engine so that a force of 8–12 ft·lbf (35–55 N·m) deflects the belt (A) 3/16 in. (5 mm) at mid-span.
15. Tighten compressor mounting hardware (B).
16. Recheck tension and readjust as required.
17. Close the hood. Refer to 5.4.2 Closing Hood (Lower Position), page 203.
18. Close the platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.

Tensioning Air Conditioner (A/C) Compressor Belt

⚠️ DANGER
Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Shut down the engine and remove the key.
2. Open the hood. Refer to 5.4.1 Opening Hood (Lower Position), page 202.
3. Loosen compressor mounting hardware (B).
4. Pry compressor away from engine so that a force of 8–12 ft·lbf (35–55 N·m) deflects the belt (A) 3/16 in. (5 mm) at mid-span.
5. Tighten compressor mounting hardware (B).
6. Recheck tension and readjust as required.
7. Close the hood, refer to 5.4.2 Closing Hood (Lower Position), page 203.

Replacing Air Conditioner A/C Compressor Belt

⚠️ DANGER
Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Shut down the engine and remove the key.
2. Open the hood. Refer to 5.4.1 Opening Hood (Lower Position), page 202.
3. Loosen compressor mounting hardware (B) and push compressor towards engine to release tension.

4. Remove belt (A) from compressor.

5. Install new compressor belt (A).

6. Pry compressor away from engine so that a force of 8–12 ft·lbf (35–55 N·m) deflects the belt (A) 3/16 in. (5 mm) at mid-span.

7. Tighten compressor mounting hardware (B).

8. Recheck tension and readjust as required.

9. Close the hood, refer to 5.4.2 Closing Hood (Lower Position), page 203.

**Engine Speed**

The maximum and idle engine speeds are factory set.

Refer to 2.2 Specifications, page 29 for detailed information. If specified speeds cannot be maintained, see your MacDon Dealer.

Refer to Engine Intermediate Speed Control (ISC), page 91 for information about engine speed.

**Throttle Adjustment**

The engine speed is controlled with the throttle lever that is connected to an electronic sensor inside the console.

The throttle lever in the cab should move the throttle sensor the full range between slow speed stop and full rpm stop without contacting the console at either position.

If the throttle lever is contacting the console and interferes with specified engine speeds, the sensor position may need adjustment. See your MacDon Dealer.
5.7.8 Electrical System

Batteries

The M105 is equipped with two batteries that are located under the engine compartment hood at the left side of the engine compartment.

Figure 5.119: Batteries
Preventing Electrical System Damage

To prevent electrical system damage, take the following precautions:

- Carefully observe polarity when attaching booster battery.
- Do NOT short across battery or alternator terminals, or allow battery positive (+) cable or alternator wire to become grounded.
- Be sure alternator connections are correct before cables are connected to battery.
- When welding on any part of the machine, disconnect battery cables and alternator wire. Refer to 1.8 Welding Precaution, page 9.
- Always disconnect battery ground cable when working with the alternator or regulator.
- Never attempt to polarize alternator or regulator.
- If wires are disconnected from the alternator, use the illustration to ensure proper reconnection.
- Never ground the alternator field terminal or field.
- Never connect or disconnect alternator or regulator wires with battery connected or alternator operating.
- Always disconnect cables from the battery when using a charger to charge battery in windrower.
- Ensure all cables are securely connected before operating engine.

Maintaining Batteries

**CAUTION**

Do NOT attempt to service battery unless you have the proper equipment and experience to perform the job. Have it done by a qualified Dealer.

- Check battery charge **once a year**, and more often if operating in cold weather. Hydrometer readings should be 1.260 to 1.300. Readings below 1.250 indicate charging is required. Refer to Charging the Battery, page 262. Add electrolyte if necessary. Refer to Adding Electrolyte to the Battery, page 265.
- Keep batteries clean by wiping with a damp cloth.
- Keep all connections clean and tight. Remove any corrosion, and wash terminals with a solution of baking soda and water. A light coating of grease on terminals (after cables are attached) will reduce corrosion.
- To prolong battery life, store batteries fully charged and at +20° to +80°F (-7° to +26°C). Check voltage after storage, and recharge as needed, according to battery and charger manufacturer recommendations.
- Do NOT stack storage batteries on top of each other.
Battery Main Disconnect Switch

A battery main disconnect switch is located on the battery tray.

Ensure switch is switched to POWER OFF position when performing major servicing to electrical components, or for periods of non-use to prevent inadvertent loss of battery charge.

Figure 5.121: Electrical System
Charging the Battery

⚠️ CAUTION ⚠️

- Ventilate the area where batteries are being charged.
- Do NOT charge a frozen battery. Warm to 60°F (16°C) before charging.
- Do NOT connect or disconnect live circuits. To prevent sparks, turn off charger and connect positive cable first. PROTECT YOUR EYES.
- If charging battery in windrower, disconnect POSITIVE battery cable before connecting charger cable, then connect ground cable last, away from battery.
- Stop or cut back charging rate if battery feels hot, or is venting electrolyte. Battery temperature must NOT exceed 125°F (52°C).
- The maximum charge rate in amperes should be NO MORE than 1/3 of the battery’s reserve capacity minute rating. If the terminal voltage exceeds 16.0 volts while charging, reduce the charge rate.
- Continue charging and reduce the rate as needed until a two hour period results in no increase in voltage or decrease in current.

⚠️ WARNING ⚠️

- Gel and AGM (Absorbed Glass Mat) batteries require a voltage-limited charger. Charging a Gel or AGM battery on a typical shop charger—even one time—may greatly shorten its life.
- If the electrolyte is accessible, verify that plates are covered before beginning to charge. At the end of charge, add distilled water as needed to bring levels to the proper height. If water is added, charge for an additional 30 minutes to mix. If electrolyte levels are low, but battery is not accessible, remove battery from service.

---

33. Charging time depends upon battery capacity, condition, age, temperature, and efficiency of charger.
MAINTENANCE AND SERVICING

**CAUTION**

Follow all instructions and precautions furnished by the battery charger manufacturer, including the following:

- Charge at recommended rates and times.
- Turn off charger prior to hook up to avoid dangerous sparks. Wear proper eye protection.
- Reduce charge rate if the terminal voltage is higher than 16.0 volts while charging. The maximum charge rate in amperes should NOT exceed 1/3 of the battery’s reserve capacity minute rating.
- Continue charging if there is no change in voltage or current for a period of two-hour and reduce the rate as needed.
- If the battery case gets hot during charging or spews large amount of gasses, temporarily stop charging.

**IMPORTANT:**

NEVER overcharge batteries. Excessive charging will shorten battery life.

To charge battery, follow these steps:

**DANGER**

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Stop the engine and remove the key.
2. Move platform on left cab-forward side of machine to open position. Refer to 5.5.1 Opening Platform (Standard Position), page 205.
3. Open hood to highest position to allow access to the batteries. Refer to 5.4.3 Opening Hood (Highest Position), page 203.
4. Remove red plastic cover (A) from positive cable clamps.
5. Remove black plastic cover (B) from negative terminals.
6. If charging battery in windrower, disconnect **positive** battery cable (A), then connect charger cable to positive post. Connect charger ground cable to the engine block last, away from battery.
7. Charge batteries in accordance with charger manufacturer’s instructions.
8. Close platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.
9. Close hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.

![Figure 5.123: Battery Terminal Location](image)
Boosting the Battery

A 12 volt battery can be connected in parallel (+ to +) with the windrower battery. Use heavy-duty battery cables.

⚠️ CAUTION

- Gas given off by batteries is explosive. Keep sparks and flames away from batteries.
- Make last connection and first disconnection at the point furthest away from the batteries.
- Wear protective eye-wear when using a booster battery.
- Be sure everyone is clear of machine when starting engine. Start engine from operator’s station only.

1. Open the engine compartment hood to the lowest position. Refer to 5.4.1 Opening Hood (Lower Position), page 202.
2. Remove red rubber cover (A) from windrower battery positive terminal.

![Figure 5.124: Battery Boost Terminal](image)

3. Attach one end of battery cable to positive terminal (A) of booster battery, and other end to positive terminal (B) of windrower batteries.
4. Attach second cable to negative terminal (C) of booster battery, and then to a good ground (D) on windrower frame.
5. Turn IGNITION switch in cab as with normal startup.
6. After engine starts, disconnect cable from windrower ground FIRST, and then disconnect the other cables.
7. Close engine compartment hood. Refer to 5.4.2 Closing Hood (Lower Position), page 203.

![Figure 5.125: Boost Cable Configuration](image)
Adding Electrolyte to the Battery

⚠️ WARNING

• Keep all smoking materials, sparks, and flames away from electrolyte container and battery, as gas given off by electrolyte is explosive.

• Battery electrolyte causes severe burns. Avoid contact with skin, eyes or clothing. Wear protective eyewear and heavy gloves.

⚠️ WARNING

• If electrolyte is spilled or splashed on clothing or on the body, neutralize it immediately with a solution of baking soda and water, then rinse with clean water.

• Electrolyte splashed into the eyes is extremely dangerous. Should this occur, force the eye open, and flood with cool, clean water for five minutes. Call a Doctor immediately.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. If battery is installed in windrower, stop the engine and remove the key.

2. Open the platform. Refer to 5.5.1 Opening Platform (Standard Position), page 205.

3. Open the hood. Refer to 5.4.3 Opening Hood (Highest Position), page 203.

4. Add electrolyte in accordance with the battery manufacturer's instructions.

5. Close the platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.

6. Close the hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.
Removing Battery

⚠️ **CAUTION**

Do not attempt to service battery unless you have the proper equipment and experience to perform the job. Have it done by a qualified Dealer.

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Open the hood, refer to 5.4.3 Opening Hood (Highest Position), page 203.

2. Open the platform, refer to 5.5.1 Opening Platform (Standard Position), page 205.

3. Remove the red plastic cover from positive cable clamps (A, C). Loosen the clamps and remove cable from batteries.

4. Loosen clamps (B, D) on negative terminals and remove cable from batteries.

5. Remove the bolt (A) that secures the battery angle (B) to the battery strap. Remove the battery angle (B).
6. Lift batteries (A) off the support.

Installing Battery

Table 5.18 Battery Specification

<table>
<thead>
<tr>
<th>Rating</th>
<th>Group</th>
<th>CCA</th>
<th>Volt</th>
<th>Qty</th>
<th>Maximum Dimension</th>
</tr>
</thead>
<tbody>
<tr>
<td>Heavy duty, off-road, vibration resistant</td>

<td>650</td>
<td>12</td>
<td>2</td>
<td>13 in. x 7.4 in. x 9.13 in.</td>
</tr>
</tbody>
</table>

1. Position new batteries (A) on battery support.

2. Install battery angle (B) and secure it with bolt (A).
MAINTENANCE AND SERVICING

IMPORTANT:
BATTERY IS NEGATIVE GROUNDED. Always connect starter cable to the positive (+) terminal of battery and battery ground cable to negative (-) terminal of battery. Reversed polarity in battery or alternator may result in permanent damage to electrical system.

3. Attach negative (black) cable clamps (B and D) to negative post on batteries and tighten clamps.
4. Attach positive (red) cable clamps (A and C) to positive post on batteries and tighten. Position plastic covers onto clamps.
5. Close the platform, refer to 5.5.2 Closing Platform (Standard Position), page 206.
6. Close the hood, refer to 5.4.4 Closing Hood (Highest Position), page 204.

Connecting Batteries

⚠️ DANGER
Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Stop the engine and remove the key.
2. The battery main disconnect switch (A) is located on the right-hand frame rail beside the batteries. Ensure battery switch (A) is switched to POWER OFF position.
3. Remove cable ties securing battery cables to battery clamp.

IMPORTANT:
BATTERY IS NEGATIVE GROUNDED. Always connect red starter cable to the positive (+) terminal of battery and black ground cable to negative (-) terminal of battery. Reversed polarity in battery or alternator may result in permanent damage to electrical system.
MAINTENANCE AND SERVICING

4. Remove plastic caps from battery posts.
5. Attach positive (red) cable terminals to positive post (A) on batteries and tighten. Reposition plastic covers onto clamps.
6. Attach negative (black) cable terminals to negative post (B) on batteries and tighten clamps.
7. Turn battery switch to POWER ON position.

Field Lights

Adjusting Field Lights

The field lights are best adjusted with the machine in the field (or equivalent) to suit Operator preference.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Hold onto handholds (A) on the cab front corners, and stand on header anti-slip strips.
2. Adjust lights with screws (A).
Replacing Field Light Bulb

1. Remove two screws (A), and remove light assembly.
2. Replace bulb as described in *Replacing Field Light Bulb, page 270*.

![Field Lights](image)

**Figure 5.139: Field Lights**

*Flood Lights: Forward*

**Adjusting Forward Flood Lights**

The forward flood lights are **NOT** adjustable.

**Replacing Bulb in Cab-Forward Flood Light**

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

Replace bulbs as follows:

1. Shut down engine and remove key. Turn lights OFF.
2. Hold onto the handholds (A) on the cab front corners and stand on the header anti-slip strips when removing the forward field lights.

3. Remove two screws (B) and remove light bezel (C).

4. Remove light from receptacle.

5. Pinch the wire retainer (A) and lift away from hooks.

6. Remove bulb (B) from body and pull wire from connector (C).

**IMPORTANT:**
Do NOT touch the glass of the halogen bulb as the oils or other chemicals from your skin will cause the bulb to fail prematurely.
7. Match slots on new bulb (B) with lugs (D) in optical unit and insert bulb into unit.
8. Secure bulb with wire retainer (A).
9. Push wire into connector (C).

10. Position light into light receptacle, ensuring top is up and secure with bezel (C) and screws (B).

**HID Auxiliary Lighting (Optional - MD #B5596)**

Two optional High Intensity Discharge (HID) lights provide additional lighting during field operation.

**Adjusting HID Auxiliary Lights (if Installed)**

If installed, HID auxiliary lights are best adjusted with the machine in the field (or equivalent) to suit Operator preference.

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.
1. Shut down engine and remove key. Turn lights ON.
2. Loosen bolt (A) and nut (B) (located inside light / mirror support).
3. Position light to desired position.
4. Tighten bolt (A) and nut (B).

Replacing HID Lamp (if Installed)

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Shut down engine and remove key. Turn lights OFF.

NOTE:
Hold onto the handholds on the cab front corners and stand on the header anti-slip strips, or stand on the maintenance platform when accessing the HID auxiliary lights.

2. Disconnect lamp connector (A) from electrical harness (B).
3. Remove grommet (A) from light support (B).

4. If replacing lamp and bracket assembly, remove nut (C) and spring washer from inside light support (B) and remove light assembly.

5. If replacing the lamp only, remove the nut, spring washer and bolt (A) securing lamp (B) to lamp bracket (C) and remove lamp (B).

6. If installing lamp only, position new lamp (B) in lamp bracket (C) and secure with bolt (A), spring washer and nut. Adjust lamp (B) to desired position and tighten bolt (A).

7. If installing light/bracket assembly, locate light in center hole in light support (B) and secure with hardware (C) provided with light assembly. Adjust light assembly to desired position and tighten nut (C).

8. Route lamp harness through grommet (A) and slot in light support (B).

9. Reinstall grommet (A) in light support (B).
10. Connect lamp plug (A) to main harness connector (B).

---

**Swath Lights**

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

The swath lights are **NOT** adjustable.

Replace bulbs as follows:

1. Shutdown the engine and remove the key.
2. Remove the two screws (A), and remove light bezel (B).
3. Remove light from receptacle.
4. Pinch the wire retainer (A), and lift away from hooks.
5. Remove bulb (B) from body, and pull wire from connector (C).

**IMPORTANT:**
Do **NOT** touch the glass of the halogen bulb as the oils or other chemicals from your skin will cause the bulb to fail prematurely.

6. Match slots on new bulb (B) with lugs (D) in optical unit, and insert bulb into unit.
7. Secure bulb with wire retainer (A).
8. Push wire into connector (C).

**IMPORTANT:**
For proper lighting pattern, be sure lights are installed right side up.

9. Position light into light receptacle, ensuring top is up, and secure with bezel (B) and screws (A).

---

**Amber Lights**

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.
1. Shut down engine and remove the key. Turn lights OFF.

**NOTE:**
Hold onto handholds (A) on cab front corners and stand on header anti-slip strips, or stand on maintenance platform when accessing the amber lights.

2. Remove two screws (B) from lens, and remove lens.
3. Push and twist light bulb to remove from socket.
4. Install new bulb, ensuring that bulb base is properly engaged in socket. Use Bulb Trade #1156.
5. Reinstall lens with screws (B).

![Figure 5.153: Amber Lights](image)

### Red Tail Lights

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Shut down engine and remove key. Turn lights OFF.
2. In the grill of the hood, remove two screws (A) from light (B), and remove light.
3. Remove connector from light.
4. Connect wiring harness to new light (B) and install light with screws (A).

![Figure 5.154: Red Tail Lights](image)

### Beacons (if installed)

Warning beacons are available as an optional Dealer-installed attachment (MD #B5582).

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.
1. Shut down engine and remove key. Turn beacons OFF.

**NOTE:**
Hold onto the handholds (B) on the cab front corners, and stand on the header anti-slip strips, or stand on the maintenance platform when accessing the beacons (A).

2. Turn lens (A) counterclockwise to unlock lens from base and remove lens.

3. Pinch retainer (A) and remove it from lamp socket.

4. Pull lamp out of socket.
5. Disconnect harness from lamp.

**IMPORTANT:**

Do **NOT** touch the glass of the halogen bulb as the oils or other chemicals from your skin will cause the bulb to fail prematurely.

6. Connect harness to new lamp, place lamp in socket, and line up the flat side on lamp with recess in socket.
7. Place retainer (A) over lamp and pinch tabs to secure retainer to socket.

8. Line up the three lugs (one is longer) in the base with slots in lens, and seat the lens against the rubber seal.
9. Turn the lens clockwise to lock it in place.

Dome Light

To replace a cabin dome light, follow these steps:

1. Shut down engine.
2. Remove two screws (A) from the dome light assembly and remove the assembly.
3. Disconnect the old dome light assembly from the wiring harness.
4. Connect the new dome light MD #183413 to the wiring harness.
5. Install the new dome light with two screws (A).

**Ambient Light**

To replace the ambient light fixture, follow these steps:

1. Shut down engine.
2. Locate the ambient light fixture (A) in the roof liner.

![Ambient Light Fixture](image1.png)

3. Push against tabs (A) with a screwdriver and pull ambient light fixture out of cab roof.
4. Remove wires from connectors (B).
5. Connect wires to new light fixture.
6. Push into place in cab roof until tabs hold fixture in place.

![Ambient Light Fixture](image2.png)

**Turn Signal Indicators**

If the turn signal indicators on the cab display module (CDM) do **NOT** function, contact your MacDon Dealer.

**Circuit Breakers and Fuses**

The circuit breakers and fuses are located inside a fuse box mounted on the right (cab-forward) side of the frame. The circuit breakers automatically reset. Fuses are the plastic blade type.

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

Access the breakers and fuses as follows:

1. Stop engine and remove key.
2. Remove wing nut (A) and remove fuse box cover (B).
3. Refer to the decal on inside of cover for identification of fuses and circuit breakers.
4. A cover may be installed over the circuit breaker. Remove it to access the breaker.

![Figure 5.166: Fuse Box](image)

Checking and Replacing Fuses

1. To check fuse, pull fuse (A) out of receptacle and visually examine.
2. To replace fuse, insert new fuse into receptacle.

**IMPORTANT:**
Replacement fuses should match rating on decal shown on following page.

![Figure 5.167: Fuses](image)

Replacing Circuit Breakers and Relays

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

Replace breakers and relays as follows:
1. Stop engine and remove key.
2. To replace circuit breaker (A), pull breaker out of receptacle and install new circuit breaker.
3. To replace relay (B), pull relay out of receptacle and install new relay.
4. Reinstall cover and secure with wing nut.

Figure 5.168: Breakers and Relays
Fuse Box Decal

Figure 5.169: Fuse Decal
Inspecting and Replacing 125A Main Fuses

The 125A main fuse holders are located on the frame under the right cab-forward side platform beside the battery.

Access the 125A main fuses as follows:

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Stop engine and remove key.

2. To check condition of fuse (A), pull tab (A) and open cover (B).

3. Visually examine fuse (B) for indications of melting.

4. Remove fuse (B), remove two nuts (C) and pull fuse free from holder (existing wiring may need to be pulled off the stud first).

5. Install new fuse on studs and any existing wiring that was removed.

6. Secure with nuts (C).
7. Close cover (B) and secure with tab (A).

5.7.9 Hydraulic System

The M105 windrower hydraulic system provides oil pressure for the windrower drive system, the header lift, and drive systems.

⚠️ WARNING

- Avoid high pressure fluids. Escaping fluid can penetrate the skin causing serious injury. Relieve pressure before disconnecting hydraulic lines.
- Tighten all connections before applying pressure. Keep hands and body away from pin-holes and nozzles which eject fluids under high pressure.
WARNING

- Use a piece of cardboard or paper to search for leaks.
- If ANY fluid is injected into the skin, it must be surgically removed within a few hours by a Doctor familiar with this type of injury or gangrene may result.

IMPORTANT:

Foreign material such as dirt, dust, and water is the major cause of trouble in the hydraulic system.

If hydraulic system components must be disconnected for service, protect the ends of hoses, tubing, and ports of components from contamination with clean, lint-free towels, or clean plastic bags.

Before installing any replacement hose, flush the inside with unused diesel fuel or unused commercial petroleum cleaning solvent for ten seconds minimum. Do NOT use water, water soluble cleaners, or compressed air.

The hydraulic system components are built to very close tolerances and have been adjusted at the factory. Do NOT attempt to service these components except to maintain proper oil level, change oil and filters, and to adjust relief pressures as described in this manual.

See your MacDon Dealer for all other service.

Checking and Filling Hydraulic Oil

Follow these steps to check and fill the hydraulic oil:

DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Park windrower on level ground and lower header and reel so that lift cylinders are fully retracted.
2. Stop the engine and remove the key.
3. Open the hood. Refer to 5.4.1 Opening Hood (Lower Position), page 202.

NOTE:
A sight glass is provided under the hood on the right side of the tank. It indicates oil level and signs of contamination. No oil in the sight glass indicates oil level is below the add mark on the dipstick.
4. If necessary, add oil to maintain a level between the LOW and FULL marks. Refer to *Lubricants, Fluids, and System Capacities, page 199* for hydraulic oil specifications and quantity.

**NOTE:**
When dipstick is showing LOW, approximately 1 US gallon (4 liters) is required to reach the FULL mark.

**IMPORTANT:**
• Use good quality, prefiltered oil.
• Exercise care to prevent debris from falling into tank.

5. Reinstall dipstick and filler cap, and turn clockwise to tighten/lock.

6. Close the hood. Refer to 5.4.2 *Closing Hood (Lower Position), page 203*.

**Hydraulic Oil Cooler**

The hydraulic oil cooler is located inside the cooling box behind the radiator.

It should be cleaned daily with compressed air. Refer to *Cleaning Cooler Box Components, page 252.*
Draining Hydraulic Oil

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

NOTE:
Change hydraulic oil every 1500 hours or every 2 years.

1. Park windrower on level ground and lower header and reel so that lift cylinders are fully retracted.
2. Stop the engine and remove the key.
3. Open the hood. Refer to 5.4.3 Opening Hood (Highest Position), page 203.
4. Place a clean container (at least 14 U.S. gallons [50 liters]) under the drain at the bottom of the hydraulic reservoir to collect the oil.
5. Remove drain plug (A) and allow oil to drain.
6. Clean off any metal debris that may have accumulated on magnetic plug. Wipe plug with a clean cloth. Check O-ring condition. Look for cracking, breakage, or deformation that may impede sealing ability and replace as required.
7. Install drain plug (A).

Changing Hydraulic Oil Filters

The charge filter (A) and return filter (B) are located just inside the frame on the left side and are accessible from under the windrower. Change as follows:

NOTE:
Change hydraulic oil filters after the first 50 hours of operation, and every 500 hours thereafter. Filter (A) (MD #112419) and filter (B) (MD #151975) can be obtained from your Dealer.
MAINTENANCE AND SERVICING

Charge Filter

The charge filter filters the oil in the windrower hydraulic charge circuit that supplies make up oil for normal losses at motor and pump case drains and associated circuits.

Refer to the following procedures to change the charge filter:

- Removing Charge Filter, page 291
- Installing Charge Filter, page 291

Removing Charge Filter

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Stop the engine and remove the key.
2. Clean around head of the filter.
3. Place a container beneath the filter to collect any oil that may leak out.
4. Unscrew filter (A) with a filter wrench.
5. Dispose of used oil and filter in accordance with local environmental legislation.

Installing Charge Filter

NOTE:
For charge filter replacement part number, refer to Filter Part Numbers, page 200.

1. Clean the gasket surface of the filter head.
2. Apply a thin film of clean oil to the filter gasket.
3. Screw the new filter (A) onto the mount until the gasket contacts the filter head.
4. Tighten filter an additional 1/2 turn by hand.

IMPORTANT:
Do NOT use a filter wrench to install oil filter. Overtightening can damage gasket and filter.

5. Check hydraulic fluid levels, refer to Checking and Filling Hydraulic Oil, page 288. For capacity level, refer to Lubricants, Fluids, and System Capacities, page 199.
MAINTENANCE AND SERVICING

Return Filter

The return filter filters the oil in the header drive systems and should be changed after the first 50 hours and then at 500 hour intervals.

To change the return filter, refer to the following procedures:

- Removing Return Filter, page 292
- Installing Return Filter, page 293

Removing Return Filter

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Stop the engine and remove the key.
2. Locate the return filter (A) inside the left frame. It is accessible from under the windrower.
3. Clean around head of the filter (A).
4. Place a container beneath the filter (A) to collect any oil that may leak out.
5. Unscrew filter (A) with a filter wrench.
6. Dispose of used oil and filter in accordance with local environmental legislation.

![Figure 5.181: Hydraulic System](image)
NOTE:
Image showing filter head removed to show component clarity.

7. Remove gasket (C) from groove (B) in filter head (A).

Installing Return Filter

NOTE:
For filter specifications, refer to Filter Part Numbers, page 200.

NOTE:
Image showing filter head removed to show component clarity.

1. Clean the gasket groove (B) in the filter head (A).
2. Apply a thin film of clean oil to the filter gasket (C).
3. Install new gasket into the groove (B) in the filter head (A).
4. Screw the new filter (D) onto the filter head until the gasket contacts the filter.
5. Tighten filter an additional 3/4 turn by hand.

IMPORTANT:
Do NOT use a filter wrench to install oil filter. Overtightening can damage gasket and filter.

Header and Reel Hydraulics

Flow Control Blocks

Two hydraulic valve blocks with multiple cartridges are used for the various windrower functions and are controlled by the windrower control module (WCM) according to the inputs from the Operator. The valve blocks are located behind the left cab-forward side platform.

The valve blocks do NOT require any scheduled maintenance other than to check for leaking fittings or loose electrical connections. If service is required, contact your MacDon Dealer.

Knife Drive Valve Block

The ON/OFF valve on the valve block turns the knife ON. It is mounted on top of the knife drive pump. The flow to the knife drive is mechanically set on the pump itself. Adjusting oil flow changes knife speed.

To set the knife speed, refer to the knife speed section for your header type:

- D-Series header: 4.6.8 Knife Speed, page 175
- A-Series header: 4.7.3 Knife Speed, page 182

Knife speed varies depending on the header size, header type, and whether the header has a single knife or double knife.

Knife speed is NOT monitored by cab display module (CDM) unless the optional expansion module MD #B4666 is installed. Refer to 7.1.10 Expansion Module, page 338.

Knife speed has been factory set for lower knife speeds.

Record the knife speed for your header type here:

- HEADER TYPE: ___________________________
- RECOMMENDED KNIFE SPEED: ___________

For units used with more than one header, knife speed will need to be changed when switching headers.
Adjusting Header Drop Rate

The header should lower gradually when the lower header switch is pressed. From full height to ground should take approximately 3–4 seconds.

If drop rate is too slow, return to cut height or tilt or float presets may time out. This is to keep the hydraulics from being pressurized.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Lower header to ground, stop the engine, and remove the key.
2. Move left cab-forward side platform rearward. Refer to 5.5.1 Opening Platform (Standard Position), page 205.
3. Loosen setscrew (B) on valve (A).
4. Turn cap (C)
   - Clockwise to decrease the drop rate
   - Counterclockwise to increase the drop rate
5. Check drop rate and readjust as required.
6. Tighten setscrew (B).

NOTE:
To reset to factory specifications, fully close the needle valve and open it four turns (counterclockwise).

7. Close the platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.

Adjusting Reel Drop Rate

The reel should lower gradually when the lower reel switch is pressed. From fully raised to fully lowered should take approximately 3–4 seconds. Drop rate is a customer preference and will vary based on crop type and cutting condition.

NOTE:
Drop speed should NOT be less than 3 to 4 seconds from all the way up to all the way down as structural damage may result.

NOTE:
If drop rate is too slow, return to cut height or tilt or float presets may time out. This is to keep the hydraulics from being pressurized.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.
1. Lower header to ground, stop the engine, and remove the key.

2. Open the left cab-forward side maintenance platform. Refer to 5.5.1 Opening Platform (Standard Position), page 205.

3. Locate valve (A) installed at port D, it controls the reel drop rate.

**NOTE:**
This valve is only installed with a draper header.

4. Loosen setscrew (B) and turn cap (C),
   - Clockwise to decrease the drop rate
   - Counterclockwise to increase the drop rate

5. Check drop rate and adjust as required

6. Tighten setscrew (B).

**NOTE:**
To reset to factory specifications, fully close the needle valve and open it four turns counterclockwise.

7. Close the platform. Refer to 5.5.2 Closing Platform (Standard Position), page 206.

---

**Traction Drive Hydraulics**

The windrower transmission consists of two variable displacement axial piston hydraulic pumps, one for each drive wheel.

The pumps are driven through a gearbox from the engine. Each pump requires charge flow in order to
   - Make up for internal leakage
   - Maintain positive pressure in the main circuit
   - Provide flow for cooling
   - Replace any leakage losses from external valving or auxiliary systems

The charge pressure is monitored. The cab display module (CDM) sounds a tone and displays a flashing warning if charge pressure drops below 250 psi (1725 kPa). Refer to 3.18.4 Cab Display Module (CDM) Warning/Alarms, page 67.

**Checking Transmission Oil Pressure**

**IMPORTANT:**
Rated charge pressure MUST be maintained under all conditions of operation to prevent damage to the transmission.

If the TRANS OIL PRESSURE warning is displayed, shut down engine, and proceed as follows:

1. Check the hydraulic fluid level in the tank. Refer to Checking and Filling Hydraulic Oil, page 288.

2. Check the hoses and lines for leakage.

3. Check the charge pressure relief valve. Refer to Checking Charge Pump Pressure, page 297.

4. If charge pressure still cannot be maintained, do NOT operate the windrower. Contact your MacDon Dealer.
Checking Charge Pump Pressure

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

Incorrect charge pressure settings may result in the inability to build required system pressure and/or inadequate loop flushing flows.

Correct charge pressure **MUST** be maintained under all conditions to maintain pump control performance and to operate the brake release.

Check charge pump pressure as follows:

1. Open hood fully. Refer to 5.4.3 Opening Hood (Highest Position), page 203.
2. Attach a 0–600 psi (4000 kPa) pressure gauge to a hose that is long enough to allow pressure gauge to be read from the operator’s seat.
3. Locate the test port (A) which is located on the charge filter head. Clean test port fitting and attach hose to the fitting.
4. Start engine, and leave at idle. Pressure should be 200 to 250 psi (1379 to 1724 kPa) with the hydraulic oil at 100°F (40°C) minimum.
5. Note reading and shut down windrower.
6. If pressure is **NOT** within this range, contact your MacDon Dealer.
7. Otherwise, remove hose from test port and close the hood. Refer to 5.4.4 Closing Hood (Highest Position), page 204.

Figure 5.189: Charge Pump Test Port
Hoses and Lines

Check hydraulic hoses and lines daily for signs of leaks.

⚠️ WARNING
- Avoid high-pressure fluids. Escaping fluid can penetrate the skin causing serious injury.
- Relieve pressure before disconnecting hydraulic lines. Tighten all connections before applying pressure.
- Keep hands and body away from pin-holes and nozzles which eject fluids under high pressure.
- If ANY fluid is injected into the skin, it must be surgically removed within a few hours by a Doctor familiar with this type of injury or gangrene may result.
- Use a piece of cardboard or paper to search for leaks.

IMPORTANT:
- Keep hydraulic coupler tips and connectors clean. Dust, dirt, water, and foreign material are the major causes of hydraulic system damage.
- DO NOT attempt to service hydraulic system in the field. Precision fits require WHITE ROOM CARE during overhaul.

5.7.10 Wheels and Tires

Drive Wheel

Inflating Drive Wheel Tire

⚠️ DANGER
- Use a safety cage if available.
- Do NOT stand over tire. Use a clip-on chuck and extension hose.
- NEVER install a tube in a cracked wheel rim.
- NEVER weld a wheel rim.
- Do NOT exceed maximum inflation pressure as per label on tire.
- Make sure all the air is removed from a tire before removing the tire from the rim.
MAINTENANCE AND SERVICING

⚠️ DANGER

• NEVER use force on an inflated or partially inflated tire. Make sure the tire is correctly seated before inflating to operating pressure.

• Do NOT remove, install or make repairs to a tire on a rim, unless you have the proper equipment and experience to perform the job. Take the tire and rim to a qualified tire repair shop.

• If the tire is NOT in correct position on the rim, or if too full of air, the tire bead can loosen on one side, causing air to leak at high speed and with great force. An air leak of this nature can thrust the tire in any direction, endangering anyone in the area.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

Visually check daily that tires have not lost pressure. Adjust pressure as required. Under-inflation of drive tires can cause side wall cracks.

Measure tire pressure annually with a gauge. Maintain tire pressure as follows:

1. Shut down the engine and remove key.
2. Determine the type and size of tire that is installed on your machine.
3. Refer to the following table to determine the appropriate tire pressure:

Table 5.19 Drive Wheel Tire Options

<table>
<thead>
<tr>
<th>Drive Wheel Tire Options</th>
<th>18.4-26 Bar</th>
<th>600 / 65 R28 Bar</th>
<th>18.4-26 Turf</th>
<th>23.1-26 Turf</th>
<th>580 / 70 R26 Turf</th>
</tr>
</thead>
<tbody>
<tr>
<td>32 psi (221 kPa)</td>
<td>26 psi (179 kPa)</td>
<td>35 psi (241 kPa)</td>
<td>20 psi (138 kPa)</td>
<td>24 psi (165 kPa)</td>
<td></td>
</tr>
</tbody>
</table>

4. Adjust tire pressure as required.

Tightening Drive Wheel Nuts

At first use, or when a wheel is removed, torque drive wheel nuts after one hour of operation. Continue with torque procedure every hour until two consecutive checks produce no movement of the nuts.

IMPORTANT:

• To avoid damage to wheel rims and studs, tighten nuts by hand, do NOT use an impact gun, do NOT use lubricant or Never-Seez® compound, and do NOT overtighten wheel nuts.

• Ensure only the manufacture's specified nuts are used.
1. Tighten drive wheel nuts (A). Ensure nuts and studs are dry with no lubricant or Never-Seez® compound. Torque each to 375 lbf ft (510 N·m) using the tightening sequence shown at right.

2. Repeat torque procedure every hour until two consecutive checks produce no movement of the nuts.

Lubricating Wheel Drive

Refer to these procedures to lubricate the wheel drive.

- Checking Wheel Drive Lubricant Level, page 300
- Adding Wheel Drive Lubricant, page 300
- Changing Wheel Drive Lubricant, page 302

Checking Wheel Drive Lubricant Level

Check the wheel drive lubricant level every 200 hours or annually.

1. Park the windrower on level ground.
2. Position windrower so that plugs (A) and (B) are horizontally aligned with the center (C) of the hub.
3. Remove plug (A) or (B). The lubricant should be visible through the port or running out slightly. If lubricant needs to be added, Refer to Adding Wheel Drive Lubricant, page 300.

NOTE:
The type of lubricant used after the first lubricant change is different from the factory supplied lubricant.
4. Reinstall plugs and tighten.

Adding Wheel Drive Lubricant

NOTE:
Do NOT mix lubricants of different brands or characteristics.
NOTE:
For lubricant specifications, Refer to *Lubricants, Fluids, and System Capacities, page 199.*

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Rotate wheel so that one of the plugs (A) is horizontally aligned with the center of the hub.
2. Stop windrower and remove key from ignition.
3. Remove the plug. The oil should be visible through the hole, or slightly running out.
4. If lubricant needs to be added, remove the second plug (B), and add lubricant until lubricant runs out at (A).

NOTE:
PRIOR TO FIRST CHANGE: use SAE 85W140, API Service, Class GL-5, Extreme Pressure Gear Lubricant.

NOTE:

5. Reinstall and tighten plugs (A) and (B).
6. Start up and operate the windrower for a few minutes, then stop and check the oil level. Refer to *Checking Wheel Drive Lubricant Level, page 300.* If necessary, add more oil.

![Wheel Drive Diagram](image)
Changing Wheel Drive Lubricant

The wheel drive lubricant should be changed after the first 50 hours and then in accordance with the maintenance schedule. Change the lubricant when it is warm.

Check the level every 200 hours or annually, and change every 1000 hours.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator's seat for any reason. A child or even a pet could engage an idling machine.

1. Park windrower on level ground and position windrower so drain plug (B) is at the lowest point.
2. Shut down the windrower and remove key from ignition.
3. Place a large enough container (about 2 quarts [2 liters]) under the lower drain plug (B).
4. Remove top plug (A), and drain lubricant. Ideally, the lubricant should be at operating temperature for good draining.

⚠️ CAUTION

Dispose oil in a manner that is in compliance with the local rules and regulations.

5. When lubricant has drained, rotate wheel so that one of the plugs (B) is horizontally aligned with the center of the hub (C) as shown.

6. Add lubricant. Refer to Adding Wheel Drive Lubricant, page 300.

NOTE:
The type of lubricant used after first lubricant change is different from factory supplied lubricant.
Servicing Drive Wheel

To service a drive wheel, refer to the following procedures:

- **Raising Drive Wheel, page 303**
- **Removing Drive Wheel, page 304**
- **Installing Drive Wheel, page 304**
- **Lowering Drive Wheel, page 305**

**Raising Drive Wheel**

This procedure can be used on both drive wheels.

⚠️ **CAUTION**

Header MUST be removed and NO weight box installed. Use a hydraulic jack with minimum lifting capacity of 5000 lb (2268 kg) to provide adequate support for the machine.

1. Remove the header.
2. Park windrower on level ground and block all wheels.

⚠️ **DANGER**

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

3. Place ground speed lever (GSL [A]) in N-DETENT (B), shut down engine, and remove key.

⚠️ **CAUTION**

Jack stand must be capable of supporting a minimum of 5000 lb (2268 kg).

4. Place a jack under the leg jack point (A) and raise the drive wheel until it is slightly off ground. Place a jack stand beneath the lift cylinder mount (B).

**NOTE:**

Do NOT place jack stand under the cylinder. Use a small metal plate on top of the jack stand.

5. Lower the windrower onto the jack stand.
Removing Drive Wheel

**CAUTION**

Use a suitable lifting device capable of supporting a minimum of 2000 lbs (907 kg) to lift the wheel assembly away from the windrower.

1. Raise the windrower drive wheel (A) off the ground. Refer to Raising Drive Wheel, page 303.
2. Remove the wheel nuts (B).
3. Remove the drive wheel (A).

Installing Drive Wheel

**NOTE:**

Windrower must be supported off the ground with stands. Refer to Raising Drive Wheel, page 303.

1. Position drive wheel (A) against wheel drive hub (B), so that air valve (C) is on the outside and tire tread (D) points forward.
   For Turf tires (diamond tread), be sure arrow on sidewall points in forward rotation.
2. Lift wheel on hub with lifting device.
3. Lower lifting device.
4. Line up the holes in the rim with the studs on the wheel drive hub and install wheel nuts (A).

**NOTE:**

To avoid damage to wheel rims and studs, tighten nuts by hand, do **NOT** use an impact gun, do **NOT** use lubricant or Never-Seez® compound, and do **NOT** overtighten wheel nuts.

5. Torque drive wheel nuts. Refer to Tightening Drive Wheel Nuts, page 299.
6. Lower the windrower, and remove jack. Refer to Lowering Drive Wheel, page 305.
7. After one hour of operation, retorque the wheel nuts. Then check every hour until two consecutive checks produce no movement of the nuts.
Lowering Drive Wheel

This procedure can be used on both drive wheels.

⚠️ CAUTION

Jack stand must be capable of supporting a minimum of 5000 lb (2268 kg).

1. Place a jack under the leg jack point (A) and raise the drive wheel slightly off the jack stand.
2. Remove the jack stand from under the cylinder lift mount (B) and lower the drive wheel to the ground.
3. Remove the jack.

Caster Wheel

Inflating Caster Tire

⚠️ DANGER

- Do NOT exceed maximum inflation pressure as per label on tire.
- Use a safety cage if available.
- Do NOT stand over tire. Use a clip-on chuck and extension hose.
- NEVER install a tube in a cracked wheel rim.
- NEVER weld a wheel rim.
- Make sure all the air is removed from a tire before removing the tire from the rim.

⚠️ DANGER

- NEVER use force on an inflated or partially inflated tire. Make sure the tire is correctly seated before inflating to operating pressure.
- Do NOT remove, install, or make repairs to a tire on a rim, unless you have the proper equipment and experience to perform the job. Take the tire and rim to a qualified tire repair shop.
- If the tire is NOT in correct position on the rim or if too full of air, the tire bead can loosen on one side, causing air to leak at high speed and with great force. An air leak of this nature can thrust the tire in any direction, endangering anyone in the area.
- To avoid severe personal injury or death caused by machine runaway, shut off engine and remove key before performing any of the following checks and/or adjustments.
MAINTENANCE AND SERVICING

Measure tire pressure annually with a gauge. Caster tire pressure should be 10 psi (69 kPa).

To maintain pressure, visually check daily that tires have not lost pressure, and adjust pressure as needed. Under-inflation of tires can cause side wall cracks.

**NOTE:**
If caster wheels shimmy, a possible cause is over-inflation.

**NOTE:**
An anti-shimmy dampener kit is available for rear caster wheels. Refer to *7.1.2 Anti-Shimmy Shocks for Casters, page 337* for information.

</tbody>
</table>

**Tightening Caster Wheel Nuts**

At first use, or when a wheel is removed, check caster wheel bolt torque as follows after 5 hours, and then at 200 hour intervals:

**NOTE:**
To avoid damage to wheel rims, do **NOT** over-tighten wheel nuts.
To tighten the caster wheel nuts on either forked or formed caster wheels, follow these steps:

1. Position wheel assembly on hub and install wheel bolts (A).
2. Tighten wheel nuts (A) to 120 ft-lbf (163 N·m) using the tightening sequence suitable for the type of caster wheel shown at right. Repeat the tightening sequence three times.

Servicing Caster Wheels

Refer to the following procedures:

- *Raising Caster Wheel (Formed and Forked)*, page 308
- *Lowering Caster Wheel (Formed and Forked)*, page 309
- *Removing Forked Caster Wheel*, page 309
- *Installing Forked Caster Wheel*, page 310
- *Removing Formed Caster Wheel*, page 310
- *Installing Formed Caster Wheel*, page 311
Raising Caster Wheel (Formed and Forked)

This procedure is the same for forked and formed caster wheels.

⚠️ DANGER

Stop engine and remove key from ignition before leaving operator’s seat for any reason. A child or even a pet could engage an idling machine.

1. Park windrower on level ground and block the drive wheels.

2. Place the ground speed lever (GSL [A]) in N-DETENT (B), stop the engine, and remove the key.

3. Raise end of walking beam (A) using a suitable lifting device capable of lifting 5000 lb (2268 kg) minimum until the caster wheel assembly (B) is slightly off the ground.

4. Place a jack stand beneath the walking beam and lower the beam until resting on the stand.
Lowering Caster Wheel (Formed and Forked)

This procedure is the same for forked and formed caster wheels.

1. Raise the end of walking beam (A) slightly, using a suitable lifting device capable of lifting minimum 5000 lb (2268 kg).
2. Remove the jack stand and lower the end of the walking beam until the caster wheel assembly (B) is on the ground.
3. Remove blocks from the drive tires.

Removing Forked Caster Wheel

⚠️ CAUTION

Wheel assemblies are heavy. Support wheel assembly before removing axle bolts.

1. Raise caster wheel. Refer to Raising Caster Wheel (Formed and Forked), page 308.
2. Remove the eight bolts (A) (four on each side of caster) attaching axle (B) and cover (C) to forked caster (E), and remove wheel assembly (D) from caster (E).
3. Remove the eight wheel nuts (A) that secure the axle (B) to the wheel (C).
4. Separate axle (B) and wheel (C).
MAINTENANCE AND SERVICING

Installing Forked Caster Wheel

1. Position wheel assembly (C) on axle assembly (B) and install wheel nuts (A).

2. Torque wheel nuts (A). Refer to Tightening Caster Wheel Nuts, page 306.

3. Position wheel assembly (D) in forked caster (E).

4. Position cover plates (C) and install eight bolts (A) (four on each side of caster) to secure axle (B) to caster (E). Torque bolts to 75–79 ft·lbf (97–107 N·m).

5. Lower caster wheel. Refer to Lowering Caster Wheel (Formed and Forked), page 309.

Removing Formed Caster Wheel

1. Raise caster wheel. Refer to Raising Caster Wheel (Formed and Forked), page 308.

2. Remove the six bolts (A) that secure the wheel (B) to the hub.

3. Remove wheel (B).
Installing Formed Caster Wheel

1. Position wheel assembly (B) on hub, and install the six wheel bolts (A).
2. Torque bolts (A). Refer to *Tightening Caster Wheel Nuts, page 306*.
3. Lower caster wheel. Refer to *Lowering Caster Wheel (Formed and Forked), page 309*.

Caster Wheels Anti-Shimmy Shocks (MD #B5346) (if installed)

Each caster can be equipped with a fluid-filled anti-shimmy dampener (A).

If installed, the mounting bolts (B) need to be checked periodically for security. Refer to *5.7.11 Maintenance Schedule, page 313*.

• Inboard bolt should be tightened to 100 ft⋅lbf (135 N⋅m).
• Outboard bolt should be tightened to 85 ft⋅lbf (115 N⋅m).
Ballast Requirements

Fluid ballasting of rear caster tires is recommended to provide adequate machine stability when using large headers on the windrower. Also, the stability of the machine varies with different attachments, windrower options, terrain, and the operator’s driving technique.

Ballast capability per tire is at a maximum fill of 75%, or when fluid is level with valve stem when the stem is positioned at 12 o’clock. Fluid can be added to any level up to maximum fill. Always add an equal amount of fluid on both sides.

**Table 5.21 Fluid Capacity and Ballast Weight**

</table>

34. Weights are given for typical calcium chloride and water mixtures. Weight is reduced by 20% if only water is used (for areas that do not require anti-freeze protection).

35. If only water is used, increase volume of water by 20% (up to maximum allowable fill per tire) to compensate.
5.7.11 Maintenance Schedule

The Maintenance Schedule specifies the recommended periodic maintenance procedures and service intervals. Regular maintenance is the best insurance against early wear and untimely breakdowns. Following this schedule will increase machine life.

For detailed instructions, refer to the various procedures in this chapter. Use the fluids and lubricants specified in 5.3.1 Recommended Fuel, Fluids, and Lubricants, page 198.

**Service Intervals:** The recommended service intervals are in hours of operation. Where a service interval is given in more than one time frame, for example, 100 hours or annually, service the machine at whichever interval is reached first.

**IMPORTANT:**
Recommended intervals are for average conditions. Service the machine more often if operated under adverse conditions (severe dust, extra heavy loads, etc.).

⚠️ **CAUTION**

Carefully follow safety messages given in 1 Safety, page 1.

**Break-In Inspections**

MAINTENANCE AND SERVICING

End of Season Service

Perform the following at the end of each operating season:

⚠️ CAUTION

Never use gasoline, naphtha or any volatile material for cleaning purposes. These materials may be toxic and/or flammable.

1. Clean the machine thoroughly.
2. Store in a dry, protected place if possible. If stored outside, always cover with a waterproof canvas or other protective material.
4. If possible, block up the header.
5. Repaint all worn or chipped painted surfaces to prevent rust.
7. Lubricate the header thoroughly, leaving excess grease on fittings to keep moisture out of bearings. Apply grease to exposed threads, cylinder rods, and sliding surfaces of components. Oil cutterbar components to prevent rust.
8. Check for worn components, and repair as necessary.
9. Check for broken components and order replacements from your MacDon Dealer. Attention to these items right away will save time and effort at beginning of next season.
10. Replace or tighten any missing or loose hardware.
11. Remove tall crop dividers (if equipped) to reduce space required for inside storage.
**MAINTENANCE AND SERVICING**

*Maintenance Schedule/Record*

**WINDROWER SERIAL NUMBER: ___________________**

Combine this record with the record in the header operator’s manual. Copy this page to continue record.

Refer to 5 Maintenance and Servicing, page 185 for details on each maintenance procedure.

</tbody>
</table>
7 Options and Attachments

7.1 Available Options and Attachments

The following options and attachments are available through your MacDon Dealer. The Dealer will require the part number (MD #) to determine pricing and availability.

7.1.1 AM/FM Radio

The cab is pre-wired for easy installation of a DIN "E"-style audio component available from your MacDon Dealer. Speakers are factory-installed.

For installation details, refer to the unloading and assembly instructions supplied with your windrower.

7.1.2 Anti-Shimmy Shocks for Casters

Prevents caster wheel shimmy when travelling at road speed.

MD #B5346
Also includes instruction MD #169661

7.1.3 Automated Steering Systems

A MacDon-approved automated steering system is available from MacDon Dealers that provide installation and support services.

MacDon windrowers are prewired for either the Trimble® AutoPilot™ hydraulically integrated steering system or the Trimble EZ-Pilot™ wheel/column based assisted steering system. The windrower’s ground speed lever (GSL) has an automated steering (autosteer) engage switch and the Trimble® display mounting kit MD #183348 is supplied in the cab.

The Trimble® AutoPilot™ system requires the MacDon automated steering hydraulic interface kit MD #B5589. Installation instruction MD #169539 is included with the kit.

Other GPS providers may supply parts in their vehicle specific installation packages or make installation kits available through MacDon Dealers.

7.1.4 Booster Spring Kit (External)

Available for headers over 6000 lb (2724 kg) to increase the float capacity.

MD #B4659 – Booster Spring Kit (external) includes two springs (one for each side) and mounting bracket.
Instruction MD #169032 is included with the bundle.

7.1.5 Booster Spring Kit (Internal)

An additional spring that is installed inside the header lift spring for increased float capacity.

MD #B5303 - includes one spring and castings for one side of the windrower.
Instruction MD #169316 is included with the bundle.
7.1.6 Draper Header Case Drain Kit

The Draper Header Case Drain kit must be installed when attaching a MacDon D50, D60, or D65 draper header with an upper cross auger (UCA) but without double draper drive. Case Drain Kit (MD #B5842) is NOT required for double draper drive headers equipped with kits (MD #B5606) and (MD #B5653).

MD #B5842

7.1.7 Draper Header Reel Drive and Lift Plumbing

Base kit required to run draper header. Includes draper header reel drive and lift plumbing (less valve) and reel fore-aft hydraulics.

NOTE:
If the last digit of windrower code is B, this bundle is already installed.

MD #B5577
Includes Instruction MD #169537.

7.1.8 Engine Block Heater

Contact your nearest Cummins Engine Distributor, and provide your engine model and serial numbers to ensure the proper heater is supplied.

7.1.9 Engine Fan Air Baffle

Prevents the windrow from being disturbed by engine cooling fan air blast.

MD #B5440
Instruction MD #169443 is included with the bundle

7.1.10 Expansion Module

Allows electronic monitoring of header knife speed, reel speed, and header angle. Also required for indexing reel speed to ground speed. The windrower must be equipped with a hydraulic center-link (MD #B4650 and #B5269) for header angle sensing: the header must be equipped with knife speed and reel speed sensors.

MD #B4666
Instruction MD #169392 is included with the bundle

7.1.11 HID Auxiliary Lighting

Provides additional field lighting. The kit includes two cab-mounted high intensity discharge (HID) lamps and installation instructions.

MD #B5596
Instruction MD #169621 is included with the bundle
7.1.12 **Hydraulic Center-Link**

Allows remote adjustment of the header angle using a hydraulic cylinder between the header and the windrower.

**NOTE:**
The optional expansion module (MD #B4666) is required for the center-link position to be displayed on the cab display module.

MD #B4650 (hydraulic center-link)
Instruction MD #169236 is included with the bundle.

and

MD #B5269 (auxiliary valve)
Instruction MD #169271 is included with the bundle.

7.1.13 **Light Header Flotation**

Available for headers that do not require as much spring tension for header float.

MD #B4664
Instruction MD #169033 is included with the bundle.

7.1.14 **Mechanical Center-Link**

The mechanical center-link provides a manually adjustable connection between the windrower and the header/mower conditioner.

MD #B4665

7.1.15 **Swath Roller**

An axle-mounted swath roller increases the windrow's resistance to wind disturbance, especially in canola or similar crops. It can be fitted with a hydraulic lift with in-cab controls.

Contact your MacDon Dealer for information.

7.1.16 **Towing Harness**

The towing harness is used together with the weight box when towing a D-Series draper header equipped with slow speed transport option behind the windrower.

MD #B5280 – Weight box harness only. Includes hitch pin and wiring for use with slow speed header transport option.
Instruction MD #169278 is included with the bundle.

7.1.17 **Training Seat**

A fold-down seat complete with a seat-belt can be mounted in the cab beside the operator’s seat for Operator training purposes.

MD #B4667
7.1.18 Transport Drawbar

The transport drawbar mounts to the walking beam and allows the M105 to tow MacDon headers equipped with a slow-speed transport system. This drawbar is to be used for hitching tow-behind swath rollers only. Requires a weight box.

MD #B5411

Instruction MD #169420 is included with the bundle.

7.1.19 Warning Beacons

Two rotating warning beacons that are designed for installation onto the pre-wired cab. The kit includes the beacons, a switch, mounting hardware, and instructions. The beacons are standard equipment for exported windrowers, and are optional for North America. Fits 2009 and newer machines.

MD #B5582

Instruction MD #169538 is included with the bundle.

7.1.20 Weight Box

To move the windrower without an attached header, attach the weight box to the header lift system. The weight box allows transporting a header behind the windrower by providing additional weight on the drive wheels.

MD #B5238 – Weight box without harness

MD #B5240 – Weight box without harness and concrete.

Instruction MD #169280 is included with the bundle.

MD #B5280 – Wiring harness for weight box. Includes hitch pin and wiring for use with slow speed transport. Use with MD #B5238 and MD #B5240. Required when towing header with SP windrower.

Instruction MD #169278 is included with the bundle.

7.1.21 Windshield Shades

Retractable sun shades for front and rear windows. Attachment hardware is included.

MD #B4866

Instruction MD #169218 is included with the bundle.

39. Weight box is required, refer to 7.1.20 Weight Box, page 340
40. Wiring harness MD #B5280 is also required to tow a header. Refer to 7.1.16 Towing Harness, page 339
8 Engine Error Codes

Example: cab display module (CDM) displays the Error Code 110S 16F 28C
1. 110S - S represents the SPN column. Locate code 110 in that column.
2. 16F - F represents the FMI column. Locate code 16 in that column.
3. 28C - C is occurrences, 28 is the quantity.
4. DESCRIPTION - Coolant Temperature High – Data Valid but Above Normal Operational Range - Moderately Severe Level Engine Coolant Temp.
5. Refer to LAMP COLOR and specific ENGINE CODES as required.

## 9 Cab Display Module (CDM) Error Codes

**NOTE:**
In the case of dual codes being shown for an item (primarily the solenoid valves), the first code indicates a SHORT CIRCUIT condition, while the second code indicates an OPEN CIRCUIT condition. IE. E41 would be a SHORT in the Reel Aft solenoids (P55, P59), while E141 would indicate an OPEN circuit.
