**Declaration of Conformity**

**Figure 1: EC Declaration of Conformity**
Introduction

This instructional manual contains safety, operating, and maintenance procedures for the MacDon R113 4.0 m (13 ft.) and R116 4.9 m (16 ft.) Pull-Type Disc Mowers. The disc mower is designed to cut, condition, and lay a wide variety of grasses and hay crops in windrows.

Carefully read all the material provided before attempting to unload, assemble, or use the machine.

Use this manual as your first source of information about the machine. If you follow the instructions provided in this manual, and use MacDon parts, the disc mower will work well for many years. If you require more detailed service information, contact your Dealer.

Use the Table of Contents and the Index to guide you to specific topics. Study the Table of Contents to familiarize yourself with how the material is organized. Keep this manual handy for frequent reference and to pass on to new Operators or Owners. Call your Dealer if you need assistance, information, or additional copies of this manual.

When setting up the machine or making adjustments, review and follow the recommended machine settings in all relevant MacDon publications. Failure to do so may compromise machine function and machine life and may result in a hazardous situation.

MacDon provides warranty for Customers who operate and maintain their equipment as described in this manual. A copy of the MacDon Industries Limited Warranty Policy, which explains this warranty, should have been provided to you by your Dealer. Damage resulting from any of the following conditions will void the warranty:

- Accident
- Misuse
- Abuse
- Improper maintenance or neglect
- Abnormal or extraordinary use of the machine
- Failure to use the machine, equipment, component, or part in accordance with the manufacturer’s instructions

Conventions

The following conventions are used in this document:

- Right and left are determined from the operator’s position. The front of the disc mower faces the crop.
- Unless otherwise noted, use the standard torque values provided in this manual.

Store the operator’s manual and the parts catalog in the plastic manual case (A) at the right side of the disc mower.

NOTE: Keep your MacDon publications up-to-date. The most current version can be downloaded from our website www.macdon.com or from our Dealer-only site (https://portal.macdon.com) (login required).
**List of Revisions**

At MacDon, we’re continuously making improvements: occasionally these improvements affect product documentation. The following list provides an account of major changes from the previous version of this document.

Chapter 1: Safety

1.1 Safety Alert Symbols

This safety alert symbol indicates important safety messages in this manual and on safety signs on the machine.

This symbol means:

• ATTENTION!
• BECOME ALERT!
• YOUR SAFETY IS INVOLVED!

Carefully read and follow the safety message accompanying this symbol.

Why is safety important to you?

• Accidents disable and kill
• Accidents cost
• Accidents can be avoided

1.2 Signal Words

Three signal words, DANGER, WARNING, and CAUTION, are used to alert you to hazardous situations. Signal words are selected using the following guidelines:

⚠️ DANGER

Indicates an imminently hazardous situation that, if not avoided, will result in death or serious injury.

⚠️ WARNING

Indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury. It may also be used to alert against unsafe practices.

⚠️ CAUTION

Indicates a potentially hazardous situation that, if not avoided, may result in minor or moderate injury. It may be used to alert against unsafe practices.
1.3 General Safety

CAUTION

The following are general farm safety precautions that should be part of your operating procedure for all types of machinery.

Protect yourself.

- When assembling, operating, and servicing machinery, wear all protective clothing and personal safety devices that could be necessary for job at hand. Do **NOT** take chances. You may need the following:
  - Hard hat
  - Protective footwear with slip-resistant soles
  - Protective glasses or goggles
  - Heavy gloves
  - Wet weather gear
  - Respirator or filter mask
- Be aware that exposure to loud noises can cause hearing impairment or loss. Wear suitable hearing protection devices such as earmuffs or earplugs to help protect against loud noises.
  - Provide a first aid kit for use in case of emergencies.
  - Keep a fire extinguisher on the machine. Be sure fire extinguisher is properly maintained. Be familiar with its proper use.
  - Keep young children away from machinery at all times.
  - Be aware that accidents often happen when Operator is tired or in a hurry. Take time to consider safest way. Never ignore warning signs of fatigue.
SAFETY

- Wear close-fitting clothing and cover long hair. Never wear dangling items such as scarves or bracelets.
- Keep all shields in place. NEVER alter or remove safety equipment. Make sure driveline guards can rotate independently of shaft and can telescope freely.
- Use only service and repair parts made or approved by equipment manufacturer. Substituted parts may not meet strength, design, or safety requirements.

- Keep hands, feet, clothing, and hair away from moving parts. NEVER attempt to clear obstructions or objects from a machine while engine is running.
- Do NOT modify machine. Unauthorized modifications may impair machine function and/or safety. It may also shorten machine’s life.
- To avoid bodily injury or death from unexpected startup of machine, ALWAYS stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

- Keep service area clean and dry. Wet or oily floors are slippery. Wet spots can be dangerous when working with electrical equipment. Be sure all electrical outlets and tools are properly grounded.
- Keep work area well lit.
- Keep machinery clean. Straw and chaff on a hot engine is a fire hazard. Do NOT allow oil or grease to accumulate on service platforms, ladders, or controls. Clean machines before storage.
- NEVER use gasoline, naphtha, or any volatile material for cleaning purposes. These materials may be toxic and/or flammable.
- When storing machinery, cover sharp or extending components to prevent injury from accidental contact.
1.4 Maintenance Safety

To ensure your safety while maintaining machine:

- Review operator’s manual and all safety items before operation and/or maintenance of machine.
- Place all controls in Neutral, stop the engine, set the park brake, remove the ignition key, and wait for all moving parts to stop before servicing, adjusting, and/or repairing.
- Follow good shop practices:
  - Keep service areas clean and dry
  - Be sure electrical outlets and tools are properly grounded
  - Keep work area well lit
- Relieve pressure from hydraulic circuits before servicing and/or disconnecting machine.
- Make sure all components are tight and that steel lines, hoses, and couplings are in good condition before applying pressure to hydraulic systems.
- Keep hands, feet, clothing, and hair away from all moving and/or rotating parts.
- Clear area of bystanders, especially children, when carrying out any maintenance, repairs, or adjustments.
- Install transport lock or place safety stands under frame before working under machine.
- If more than one person is servicing machine at same time, be aware that rotating a driveline or other mechanically-driven component by hand (for example, accessing a lubricant fitting) will cause drive components in other areas (belts, pulleys, and knives) to move. Stay clear of driven components at all times.
- Wear protective gear when working on machine.
- Wear heavy gloves when working on knife components.
1.5 Hydraulic Safety

- Always place all hydraulic controls in Neutral before dismounting.
- Make sure that all components in hydraulic system are kept clean and in good condition.
- Replace any worn, cut, abraded, flattened, or crimped hoses and steel lines.
- Do NOT attempt any makeshift repairs to hydraulic lines, fittings, or hoses by using tapes, clamps, cements, or welding. The hydraulic system operates under extremely high-pressure. Makeshift repairs will fail suddenly and create hazardous and unsafe conditions.

- Wear proper hand and eye protection when searching for high-pressure hydraulic leaks. Use a piece of cardboard as a backstop instead of hands to isolate and identify a leak.
- If injured by a concentrated high-pressure stream of hydraulic fluid, seek medical attention immediately. Serious infection or toxic reaction can develop from hydraulic fluid piercing the skin.

- Make sure all components are tight and steel lines, hoses, and couplings are in good condition before applying pressure to a hydraulic system.
1.6 Tire Safety

**WARNING**

- Service tires safely.
- A tire can explode during inflation which could cause serious injury or death.
- Follow proper procedures when mounting a tire on a wheel or rim. Failure to do so can produce an explosion that may result in serious injury or death.

**WARNING**

- Do NOT stand over tire. Use a clip-on chuck and extension hose.
- Do NOT exceed maximum inflation pressure indicated on tire label.
- Replace tires that have defects.
- Replace wheel rims that are cracked, worn, or severely rusted.
- Never weld a wheel rim.
- Never use force on an inflated or partially inflated tire.
- Make sure tire is correctly seated before inflating to operating pressure.
- If tire is not correctly positioned on rim or is overinflated, tire bead can loosen on one side causing air to escape at high speed and with great force. An air leak of this nature can thrust tire in any direction endangering anyone in area.
- Make sure all air is removed from tire before removing tire from rim.
- Do NOT remove, install, or repair a tire on a rim unless you have proper equipment and experience to perform job.
- Take tire and rim to a qualified tire repair shop.
1.7 Safety Signs

- Keep safety signs clean and legible at all times.
- Replace safety signs that are missing or illegible.
- If original part on which a safety sign was installed is replaced, be sure repair part also bears current safety sign.
- Replacement safety signs are available from your MacDon Dealer Parts Department.

![Figure 1.16: Operator's Manual Decal](image)

1.7.1 Installing Safety Decals

1. Clean and dry installation area.
2. Decide on exact location before you remove decal backing paper.
3. Remove smaller portion of split backing paper.
4. Place decal in position and slowly peel back remaining paper, smoothing decal as it is applied.
5. Prick small air pockets with a pin and smooth out.
1.8 Locating Safety Sign Decals

Figure 1.17: Safety Sign Decal Locations Top View

1.9 Understanding Safety Signs

NOTE:
This is a general list of safety sign definitions and the decals listed may not necessarily be applied to your machine.

MD #113482
General hazard pertaining to machine operation and servicing.

CAUTION
- Read the operator’s manual, and follow all safety instructions. If you do not have a manual, obtain one from your Dealer.
- Do NOT allow untrained persons to operate the machine.
- Review safety instructions with all Operators annually.
- Ensure that all safety signs are installed and legible.
- Make certain everyone is clear of machine before starting engine, and during operation.
- Keep riders off the machine.
- Keep all shields in place and stay clear of moving parts.
- Disengage disc mower drive, put transmission in Neutral, and wait for all movement to stop before leaving operator’s position.
- Shut off engine and remove key from ignition before servicing, adjusting, lubricating, cleaning, or unplugging machine.
- Engage locks to prevent lowering of disc mower before servicing in the raised position.
- Use slow moving vehicle emblem and flashing warning lights when operating on roadways unless prohibited by law.

MD #166466
Hydraulic pressure oil hazard

WARNING
- High pressure oil easily punctures skin causing serious injury, gangrene, or death.
- If injured, seek emergency medical help.
- Do NOT use finger or skin to check for leaks.
- Lower load or relieve hydraulic pressure before loosening fittings.
MD #171287
Crushing hazard

**WARNING**
- Engage safety lock before going under unit.
- Failure to comply could result in death or serious injury.

MD #174436
High pressure oil hazard

**WARNING**
- High pressure oil easily punctures skin causing serious injury, gangrene, or death.
- If injured, seek emergency medical help. Immediate surgery is required to remove oil.
- Do NOT use finger or skin to check for leaks.
- Lower load or relieve hydraulic pressure before loosening fittings.

MD #184371
Open drive hazard

**WARNING**
- Guard missing. Do NOT operate.
- Keep all shields in place.
MD #184372
General hazard pertaining to machine operation and servicing.

CAUTION
- Read the operator’s manual, and follow all safety instructions. If you do not have a manual, obtain one from your Dealer.
- Do NOT allow untrained persons to operate the machine.
- Review safety instructions with all Operators annually.

MD #184385
Entanglement hazard

CAUTION
- To avoid injury from entanglement with rotating auger, stand clear of disc mower while machine is running.

MD #184386
Pinch hazard

WARNING—KEEP AWAY
- Failure to comply could result in death or serious injury.
**SAFETY**

**MD #184422**
Open drive hazard

**WARNING**
- Guard missing. Do **NOT** operate.
- Keep all shields in place.

![Figure 1.33: MD #184422](image)

**MD #190546**
Slippery surface

**WARNING—DON’T PLACE FOOT**
- Do **NOT** use this area as a step or platform.
- Failure to comply could result in serious injury or death.

![Figure 1.34: MD #190546](image)

**MD #194464**
Shut down for service

**WARNING**
- Remove key from ignition.
- Read the disc mower and tractor manufacturer’s manuals for inspection and maintenance instructions.

![Figure 1.35: MD #194464](image)
MD #194465
Rotating cutters

**WARNING—STAND CLEAR**
- Contact with blades or thrown objects can result in serious injury or death.
- Do **NOT** stand on or near machine when in operation.
- Do **NOT** operate with covers or curtains open or removed.
- Shut off tractor and remove key before opening covers.

MD #194466
Rotating fingers under hood

**WARNING—STAND CLEAR**
- Crop materials exiting at high speed.
- Stop machine, look, listen, and wait for all movement to stop before approaching.
- Failure to comply could result in death or serious injury.

MD #246956
Keep shields in place

**WARNING**
- Do **NOT** operate without shields/guards in place.
- Failure to comply will result in death or serious injury.
MD #246959
Pinch hazard

**WARNING**—**KEEP AWAY**
- Failure to comply could result in death or serious injury.

MD #247166
Moving implement hazard

**WARNING**
- To avoid injury, do **NOT** mount or ride machine while the machine is in motion.

MD #247167
Rotating blades

**WARNING**
- Disengage power take-off, shut off tractor, and remove key before opening covers.
- Listen and look for evidence of rotation before lifting cover.
- Cutters may continue to rotate after power is shut off due to inertia.
MD #259058
Off-center tracking hazard

WARNING
• Rotate valve handle to lock when in transport position.
• Failure to comply could result in death or serious injury.
• To avoid hazard, review the disc mower operator’s manual before moving into transport or working position.

1.10 Operational Safety

⚠️ CAUTION
Follow these safety precautions:
• Follow all safety and operational instructions provided in your operator’s manuals.
• Never attempt to start the engine or operate the machine except from the seat.
• Check the operation of all controls in a safe and clear area before starting work.
• Do NOT allow riders on the equipment.

⚠️ CAUTION
• Never start or move the machine until you are sure all bystanders have cleared the area.
• Avoid travelling over loose fill, rocks, ditches, or holes.
• Drive slowly through gates and doorways.
• If possible, travel uphill or downhill when working on inclines. Be sure to keep transmission in gear while travelling downhill.
• Never attempt to get on or off a moving machine.
• Do NOT get off the tractor while the disc mower is in operation. Stop forward movement of the tractor, and stop the power take-off.
• To avoid bodily injury or death from unexpected startup of machine, always stop tractor engine, and remove key before adjusting or removing plugged material from the machine.
• Check for excessive vibration and unusual noises. If there is any indication of trouble, shut down and inspect the machine. Follow proper shutdown procedure shown in 3.12 Shutdown Procedure, page 57.
• Operate only in daylight or good artificial light.
1.11 Owner/Operator Responsibilities

CAUTION

- It is your responsibility to read and understand this manual completely before operating the disc mower. Contact your MacDon Dealer if an instruction is not clear to you.
- Follow all safety messages in the manual and on safety decals on the machine.
- Remember that YOU are the key to safety. Good safety practices protect you and the people around you.
- Before allowing others to operate the disc mower, for however short a time or distance, make sure they have been instructed in its safe and proper use.
- Review the manual and all safety related items with all Operators annually.
- Be alert for other Operators not using recommended procedures or not following safety precautions. Immediately correct mistakes to prevent accidents.
- Do NOT modify the machine. Unauthorized modifications may impair function and/or safety and affect machine life.
- The safety information given in this manual does not replace safety codes, insurance needs, or laws governing your area. Be sure your machine meets the standards set by these regulations.
- Ensure that the tractor is properly equipped to safely operate the disc mower. This may include adding ballast according to tractor operator’s manual requirements for attachments of this size and mass.
## Chapter 2: Product Overview

### 2.1 Definitions

The following terms and acronyms may be used in this manual:

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>API</td>
<td>American Petroleum Institute</td>
</tr>
<tr>
<td>APT</td>
<td>Articulated Power Turn</td>
</tr>
<tr>
<td>ASTM</td>
<td>American Society of Testing and Materials</td>
</tr>
<tr>
<td>Bolt</td>
<td>A headed and externally threaded fastener that is designed to be paired with a nut</td>
</tr>
<tr>
<td>Center-link</td>
<td>A hydraulic cylinder link between header and machine used to change header angle</td>
</tr>
<tr>
<td>CGVW</td>
<td>Combined gross vehicle weight</td>
</tr>
<tr>
<td>Disc mower</td>
<td>A machine that cuts and conditions hay and is pulled by an agricultural tractor</td>
</tr>
<tr>
<td>Export disc mower</td>
<td>Machine configuration typical outside North America</td>
</tr>
<tr>
<td>FFFFT</td>
<td>Flats from finger tight</td>
</tr>
<tr>
<td>Finger tight</td>
<td>Finger tight is a reference position where sealing surfaces or components are making contact with each other, and fitting has been tightened to a point where fitting is no longer loose</td>
</tr>
<tr>
<td>GVW</td>
<td>Gross vehicle weight</td>
</tr>
<tr>
<td>Hard joint</td>
<td>A joint made with use of a fastener where joining materials are highly incompressible</td>
</tr>
<tr>
<td>Header or Rotary Header</td>
<td>The part of the disc mower that cuts and conditions the crop</td>
</tr>
<tr>
<td>Hex key</td>
<td>A tool of hexagonal cross-section used to drive bolts and screws that have a hexagonal socket in head (internal-wrenching hexagon drive); also known as an Allen key and various other synonyms</td>
</tr>
<tr>
<td>hp</td>
<td>Horsepower</td>
</tr>
<tr>
<td>JIC</td>
<td>Joint Industrial Council: A standards body that developed standard sizing and shape for original 37° flared fitting</td>
</tr>
<tr>
<td>n/a</td>
<td>Not applicable</td>
</tr>
<tr>
<td>North American disc mower</td>
<td>Disc mower configuration typical in North America</td>
</tr>
<tr>
<td>NPT</td>
<td>National Pipe Thread: A style of fitting used for low-pressure port openings. Threads on NPT fittings are uniquely tapered for an interference fit</td>
</tr>
<tr>
<td>Nut</td>
<td>An internally threaded fastener that is designed to be paired with a bolt</td>
</tr>
<tr>
<td>ORB</td>
<td>O-ring boss: A style of fitting commonly used in port openings on manifolds, pumps, and motors</td>
</tr>
<tr>
<td>ORFS</td>
<td>O-ring face seal: A style of fitting commonly used for connecting hoses and tubes. This style of fitting is also commonly called ORS, which stands for O-ring seal</td>
</tr>
<tr>
<td>PTO</td>
<td>Power take-off</td>
</tr>
<tr>
<td>RoHS (Reduction of Hazardous Substances)</td>
<td>A directive by the European Union to restrict use of certain hazardous substances (such as hexavalent chromium used in some yellow zinc platings)</td>
</tr>
<tr>
<td>Term</td>
<td>Definition</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>rpm</td>
<td>Revolutions per minute</td>
</tr>
<tr>
<td>R1 Series header</td>
<td>MacDon R113 SP disc headers for windrowers</td>
</tr>
<tr>
<td>SAE</td>
<td>Society of Automotive Engineers</td>
</tr>
<tr>
<td>Screw</td>
<td>A headed and externally threaded fastener that threads into preformed threads or forms its own thread into a mating part</td>
</tr>
<tr>
<td>Soft joint</td>
<td>A joint made with use of a fastener where joining materials are compressible or experience relaxation over a period of time</td>
</tr>
<tr>
<td>Tension</td>
<td>Axial load placed on a bolt or screw, usually measured in Newtons (N) or pounds (lb.)</td>
</tr>
<tr>
<td>TFFT</td>
<td>Turns from finger tight</td>
</tr>
<tr>
<td>Torque</td>
<td>The product of a force X lever arm length, usually measured in Newton-meters (Nm) or foot-pounds (lbf-ft)</td>
</tr>
<tr>
<td>Torque angle</td>
<td>A tightening procedure where fitting is assembled to a precondition (finger tight) and then nut is turned farther a number of degrees to achieve its final position</td>
</tr>
<tr>
<td>Torque-tension</td>
<td>The relationship between assembly torque applied to a piece of hardware and axial load it induces in bolt or screw</td>
</tr>
<tr>
<td>Tractor</td>
<td>Agricultural-type tractor</td>
</tr>
<tr>
<td>Washer</td>
<td>A thin cylinder with a hole or slot located in the center that is to be used as a spacer, load distribution element, or locking mechanism</td>
</tr>
</tbody>

</tbody>
</table>

**NOTE:**
Tractor must be equipped with a cab.

---

5. Road Friendly Transport™ system option uses same hydraulic circuit as hitch swing.
6. Single-acting header lift circuit is converted to double-acting when Road Friendly Transport™ system option is installed.
Chapter 3: Operation

3.1 Lift Cylinder Lock-Out Valves

To prevent unintentional raising or lowering of the disc mower, engage the lift cylinder lock-out valves before servicing, repairing, or unplugging your machine. The lift cylinder lock-out valves are located on the lift cylinders at the back of the disc mower.

3.1.1 Engaging Locks

⚠️ WARNING
To avoid bodily injury or death from fall of raised machine, always lock out lift cylinders before going under disc mower for any reason.

IMPORTANT:
Connect hoses so that moving the cylinder control lever backward raises the disc mower, and moving the cylinder control lever forward lowers the disc mower. Refer to 3.7.3 Connecting Hydraulics, page 46 for more information.

1. Move cylinder control lever (A) backward to position (B) to fully raise machine.

2. Close the lock-out valve (A) on each lift cylinder by turning the handle to the closed position (90 degree angle to the hose).
3.1.2 Disengaging Locks

DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

1. Open the lock-out valve (A) on each lift cylinder by turning the handle to the open position (in line with the hose).

2. Move cylinder control lever (A) forward to position (B) to lower machine.

Figure 3.3: Lift Cylinder Lock-Out Valve

Figure 3.4: Tractor Cylinder Control Lever
3.2 Opening/Closing Driveshields

3.2.1 Opening Driveshields

⚠ CAUTION
Do NOT operate the machine without the driveshields in place and secured.

NOTE:
Images shown in this procedure are for left driveshield—right driveshield is similar.

1. Remove lynch pin (A) and tool (B) from pin (C).

2. Insert flat end of tool (A) into latch (B) and turn it counterclockwise to unlock.
3. Pull top of driveshield (A) away from header to open.

**NOTE:**
For improved access, lift driveshield off the pins at the base of the shield, and lay the shield on the header.

![Figure 3.8: Driveshield](image)
3.2.2 Closing Driveshields

⚠️ CAUTION
Do NOT operate the machine without the driveshields in place and secured.

NOTE:
Images shown in this procedure are for left driveshield—right driveshield is similar.

1. Position driveshield onto pins at base of driveshield (if necessary).
2. Push driveshield (A) to engage latch (B).
3. Check that driveshield is properly secured.

4. Replace tool (B) and lynch pin (A) on pin (C).

3.3 Cutterbar Doors

⚠️ WARNING
Do NOT operate the machine without all the cutterbar doors down or without curtains installed and in good condition.
Two doors (A) with rubber curtains provide access to the cutterbar area.

Curtains (B) and (C) are attached to each front corner and at the center respectively. Always keep curtains lowered when operating the disc mower.

Rotary disc mowers sold outside of North America have latches on the cutterbar door.

**IMPORTANT:**
Replace curtains if they become worn or damaged. Refer to 4.4.2 Replacing Curtains, page 127.

### 3.3.1 Opening Cutterbar Doors

To open cutterbar doors on a disc mower with export latches, refer to 3.3.2 Opening Cutterbar Doors: Export Latches, page 36.

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Center mower beneath hitch to open both doors.
2. Lift door at front to open.

### 3.3.2 Opening Cutterbar Doors: Export Latches

Headers sold outside North America require a tool-operated latch on the cutterbar doors. Follow these steps to open cutterbar doors with export latches:

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.
1. Center mower beneath hitch to open both doors.

2. Locate the latch access holes (A) for each door.

3. Use a rod or screwdriver to press down on the latch (A) and release the cutterbar door.

4. Lift up on door (A) while pressing down on latch.
3.3.3 Closing Cutterbar Doors

⚠️ CAUTION
To avoid injury, keep hands and fingers away from corners of doors when closing.

1. Pull door (A) at top to close.

2. Ensure that curtains hang properly and completely enclose cutterbar area.

3.4 Daily Start-Up Check
Perform the following checks each day before startup:

⚠️ CAUTION
- Ensure the tractor and the disc mower are properly attached, all controls are in neutral, and the tractor brakes are engaged.
- Clear the area of other persons, pets etc. Keep children away from machinery. Walk around the disc mower to make sure no one is under, on, or close to it.
- Wear close-fitting clothing and protective shoes with slip resistant soles. As well, carry with you any protective clothing and personal safety devices that could be necessary throughout the day. Don’t take chances.
- Remove foreign objects from the machine and surrounding area.
OPERATION

Protect yourself. You may need the following:
- A hard hat
- Protective footwear with slip-resistant soles
- Protective glasses or goggles
- Heavy gloves
- Wet weather gear
- A respirator or filter mask

Use proper hearing protection:
Be aware that exposure to loud noise can cause impairment or loss of hearing. Wear suitable hearing protection such as earmuffs or earplugs to help protect against loud noises.

1. Check the machine for leaks or any parts that are missing, broken, or not working correctly.

NOTE:
Use proper procedure when searching for pressurized fluid leaks. Refer to 4.6.1 Checking Hydraulic Hoses and Lines, page 252.

2. Clean all lights and reflective surfaces on the machine, and check lights for proper operation.

3. Perform all daily maintenance. Refer to 4.3.1 Maintenance Schedule/Record, page 112.

3.5 Preparing Tractor for Disc Mower

3.5.1 Tractor Requirements
The tractor used to pull the disc mower must meet the requirements outlined in the following table:
Table 3.1 Tractor Requirements

<table>
<thead>
<tr>
<th>Mower Width</th>
<th>Minimum Power</th>
<th>Minimum Drawbar Capacity</th>
<th>Minimum Hydraulics</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0 m (13 ft.)</td>
<td>75 kW (100 hp)</td>
<td>In accordance with ASAE</td>
<td>13.7 MPa (2000 psi)</td>
</tr>
<tr>
<td>4.9 m (16 ft.)</td>
<td>93 kW (125 hp)</td>
<td>In accordance with ASAE</td>
<td>13.7 MPa (2000 psi)</td>
</tr>
</tbody>
</table>

NOTE:
Tractor must be equipped with a seven-terminal outlet to supply power to the disc mower's hazard lights.

NOTE:
Static vertical load on drawbar is 907 kg (2000 lb.).

3.5.2 Adjusting the Drawbar

⚠️ CAUTION
Shut off tractor, engage parking brake, and remove key before working around hitch.

1. Adjust tractor drawbar to meet the specifications listed in Table 3.2, page 40.
2. Secure the tractor drawbar so the hitch pinhole is directly below the driveline.

Table 3.2 SAE Standard A482 Specifications

<table>
<thead>
<tr>
<th>Dimension</th>
<th>1-3/8 in. Diameter</th>
<th>1-3/4 in. Diameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>406 mm (16 in.)</td>
<td>508 mm (20 in.)</td>
</tr>
<tr>
<td>Y</td>
<td>200–350 mm (7-7/8–13-3/4 in.)</td>
<td><strong>203 mm (8 in.) recommended</strong></td>
</tr>
<tr>
<td>Z</td>
<td>330–432 mm (13–17 in.)</td>
<td><strong>406 mm (16 in.) recommended</strong></td>
</tr>
</tbody>
</table>
3.6 Setting up the Disc Mower Hitch

MacDon R113 and R116 Pull-Type Disc Mowers are factory fitted for either a drawbar or two-point hitch. Your Dealer will have installed the proper hitch adapter for your tractor.

3.6.1 Installing Drawbar Hitch Adapter

IMPORTANT:
The hitch adapter is compatible with Class 2 and Class 3 hitches only. Class 4 hitches are too big. Do NOT attempt to modify a Class 4 hitch or hitch adapter to make them fit together.

⚠️ CAUTION

Shut off tractor, engage parking brake, and remove key before working around hitch.

1. Remove hairpin (A) and pin (B).
2. If necessary, loosen four top jam nuts (C), and then loosen four lower nuts (D) so that hitch adapter (E) will slide onto tractor drawbar (F).
3. Align hole in adapter (E) with hole in drawbar (F) and install pin (B). Secure with hairpin (A).
4. Gradually tighten the four nuts (D) to 540 Nm (400 lbf·ft).
   NOTE:
   Ensure hardened washers and Class 10 nuts (supplied with adapter) are used.
5. Tighten four jam nuts (C).

3.7 Attaching Disc Mower to the Tractor

Refer to the attachment procedure that applies to your tractor:

- 3.7.1 Attaching with Drawbar Hitch, page 41
- 3.7.2 Attaching with Two-Point Hitch, page 43

3.7.1 Attaching with Drawbar Hitch

⚠️ CAUTION

Shut off tractor, engage parking brake, and remove key before working around hitch.
1. Remove lynch pin (A) from clevis pin (B), and remove clevis pin from disc mower hitch.

![Figure 3.23: Disc Mower Hitch](image)

2. Move tractor to position drawbar hitch adapter (A) under pin (B) in disc mower hitch. Adjust height as necessary with jack.

3. Shut down tractor and remove key from ignition.

![Figure 3.24: Disc Mower Hitch](image)

4. Lower hitch with the jack so that pin (A) engages drawbar hitch adapter (B).

5. Install clevis pin (C) and secure with lynch pin (D).

![Figure 3.25: Disc Mower Hitch](image)
6. Position primary driveline (A) onto tractor power take-off (PTO).

7. Pull back collar (B) on driveline (A), and push driveline until it locks. Release collar.

8. Route safety chain (C) from disc mower through chain support (D) on drawbar hitch adapter and around tractor drawbar support. Lock hook on chain.

**IMPORTANT:**
If the tractor has a three-point hitch, lift the links as far as possible to prevent damage to the hitch.

9. Raise jack (A), and remove pin (B).

10. Move jack (A) to storage position on top of hitch, and secure with pin (B).

11. Proceed to 3.7.3 Connecting Hydraulics, page 46.

---

**3.7.2 Attaching with Two-Point Hitch**

Follow these steps to attach category II, IIIIN, and III two-point hitches:

⚠️ **CAUTION**
Shut off tractor, engage parking brake, and remove key before working around hitch.
1. Position tractor and align tractor hitch arms (A) with hitch adapter (B).

2. Shut off tractor and remove key.

3. Remove lynch pins (C) and washers from hitch adapter.

4. Secure arms (A) onto adapter pins (D) with lynch pins (C).

**NOTE:**
If tractor is equipped with a category III hitch, use a bushing (MD #224322) on each hitch pin (D).

**NOTE:**
If using a category III hitch, a longer driveshaft may be required. Refer to 5.1 Optional Kits, page 275 to order.

5. Install anti-sway bars (not shown) on tractor hitch to stabilize lateral movement of hitch arms (A). Refer to your tractor operator’s manual.

6. Check distance (C) between tractor primary power take-off (PTO) shaft (A) and disc mower hitch gearbox shaft (B) (without the front half of the driveline attached).

7. Ensure that distance measurement (C) does **NOT** exceed the dimensions listed in Table 3.3, page 44.

<table>
<thead>
<tr>
<th>Driveline Shaft Size</th>
<th>Distance (C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>34 mm (1-3/8 in.)</td>
<td>650 mm (25-9/16 in.)</td>
</tr>
<tr>
<td>43 mm (1-3/4 in.)</td>
<td>750 mm (29-1/2 in.)</td>
</tr>
</tbody>
</table>

8. Position primary driveline (A) onto tractor PTO shaft, making sure that driveline is approximately level.

9. Pull back collar on driveline (A) and push driveline until it locks. Release collar.

7. If distance (C) is greater than the values shown, a longer driveline is required.
10. Clear bystanders from the area and start tractor. Do **NOT** operate the disc mower.

11. Start tractor and raise hitch so that stand (A) is off the ground. Shut down tractor and remove key from ignition.

12. Remove inner hairpin (B) and pull lock (C) to release stand.

13. Raise stand (A), rotate lock (B) clockwise to vertical position, and re-engage lock (B) to hold the stand in the storage location.

3.7.3 Connecting Hydraulics

**WARNING**

Do NOT use remote hydraulic system pressures over 20,684 kPa (3000 psi). Check your tractor operator’s manual for remote system pressure.

**NOTE:**

Refer to numbered/colored bands on hoses to identify lift, swing/transport, and tilt hose sets.

**Table 3.4 Hydraulic System Hoses**

<table>
<thead>
<tr>
<th>System</th>
<th>Hose Identification</th>
<th>Tractor Hydraulics</th>

</tr>
</tbody>
</table>

1. Connect the lift cylinder hose (red collar with #1) to the tractor’s hydraulic receptacle. The second hose (blue collar with #1) is required only when the Road Friendly Transport™ is installed. Refer to Table 3.5, page 46 to confirm system is functioning correctly.

2. Connect the two hitch swing cylinder hoses (collars with #2) to the tractor hydraulic receptacles. Refer to Table 3.6, page 46 to confirm system is functioning correctly.

3. For machines with hydraulic center-link only, connect the two disc mower tilt cylinder hoses (collars with #3) to the tractor hydraulic receptacles. Refer to Table 3.7, page 46 to confirm system is functioning correctly.

8. Available with hydraulic tilt option installed.
3.7.4 Connecting Electrical Wiring Harness

1. Ensure that pin #4 (A) in the tractor receptacle is NOT continuously energized (refer to your tractor operator’s manual). If necessary, remove the appropriate fuse.

**IMPORTANT:**
Older model tractors may have pin #4 (A) energized as an accessory circuit; however, pin position (B) is used to supply power to the disc mower brake lights.

2. Connect the disc mower wiring harness connector (C) to the tractor receptacle.

**NOTE:**
The connector is designed to fit tractors equipped with a round seven-pin receptacle (SAE J560).

3. **If equipped with the Road Friendly Transport™ system:**

   - Retrieve Road Friendly Transport™ system control box (A) and place in tractor cab. Route harness through hose support.

4. Locate the connector (C) that branches off the seven pole trailer plug (A) and attach it to the remote wiring harness (B).
If your tractor has a 3-pin auxiliary power connection (A):

5. Connect the two wires (B) from the 3-pin auxiliary connector to the power wires (C) on the remote control, wrap connections with electrical tape, and skip to Step 7, page 49.

Figure 3.39: Three-Pin Auxiliary Connector

If your tractor does not have a 3-pin auxiliary power connection:

6. Connect the remote control power wire (A) to the tractor’s power supply.
   - Connect wire (C) with the red tag to tractor power
   - Connect wire (B) with no tag to tractor ground

**NOTE:**
If the red tag is missing, identify the power by locating the wire with the number one printed on it. The ground wire has a number two printed on it.

**NOTE:**
If red light does not illuminate when switch is in field mode, check for correct polarity of power and ground wire connection. Control box includes reverse polarity protection.

Figure 3.40: Remote Control
NOTE:
The Road Friendly Transport™ control box has a 10 amp fuse (A) inside. If this fuse fails, the transport function will not activate.

7. Place the remote control inside the tractor cab.

3.8 Detaching Disc Mower from Tractor

3.8.1 Detaching from Drawbar

⚠️ CAUTION
- To prevent accidental movement of tractor, shut off engine, engage parking brake, and remove key.
- To maintain stability, always lower the machine completely. Block disc mower wheels before detaching from tractor.

1. Park machine on flat, level surface.
2. Lower disc mower onto blocks or leave disc mower raised.

IMPORTANT:
If leaving disc mower in raised position, close steering valve and both (left/right) lift cylinder lock-out valves.
3. Shut off engine and remove key.
4. Move remote cylinder control valve lever back and forth to relieve stored hydraulic pressure.
If Road Friendly Transport™ is installed:

5. Disconnect power wires (C) and (D) from remote control (A).

6. Roll up cable (B) and attach remote control (A) to the hitch with the magnet on the back of the remote control box.

7. Disconnect hydraulic hoses and electrical harness from the tractor and store hose ends and electrical connector in hose support (A) at front of hitch as shown.
8. Pull pin (B) securing jack (A) at storage location and remove the jack.

9. Move jack (A) to working position and secure with pin (B).

10. Lower jack to remove the weight from the tractor drawbar.

12. Disconnect safety chain (B) from drawbar and store on the hitch.

13. Pull back collar (A) on driveline, slide coupler off tractor power take-off shaft, and rest driveline on hook (not shown).
14. Remove lynch pin (D) and clevis pin (C).
15. Raise disc mower hitch using the jack until pin (A) disengages and clears drawbar hitch adapter (B).

16. Replace clevis pin (B) and secure with lynch pin (A).

3.8.2 Detaching from Two-Point Hitch

⚠️ CAUTION

- To prevent accidental movement of tractor, shut off engine, engage parking brake, and remove key.
- To maintain stability, always lower the machine completely. Block disc mower wheels before detaching from tractor.

1. Park machine on flat, level surface.
2. Lower disc mower onto blocks or leave disc mower raised.

IMPORTANT:
If leaving disc mower in raised position, close steering valve and both left and right lift cylinder lock-out valves.

3. Shut off engine, and remove key.
4. Move remote cylinder control valve lever back and forth to relieve stored hydraulic pressure.
If Road Friendly Transport™ is installed:

5. Disconnect the power wires from the control (A).

6. Roll up cable (B) and attach remote control (A) to the hitch with the magnet on the back of the remote control box.

7. Disconnect hydraulic hoses and electrical harness. Store hose ends and electrical connector at front of hitch as shown.

**NOTE:**
Remote control (A) is also stored at front of hitch.
8. Pull back collar (A) on driveline, slide coupler off tractor power take-off shaft, and rest driveline on hook (not shown).

9. Remove inboard hairpin (A) from lock.

10. Hold stand (A), and pull lock (B) to disengage stand.
11. Lower stand (A), rotate lock (C) counterclockwise to horizontal position, and push lock to engage stand.

12. Check that stand (A) is locked.

13. Secure lock (C) with hairpin (B).

14. Clear bystanders from the area and start tractor. Do NOT operate the disc mower.

15. Start tractor and lower hitch to take weight off tractor hitch points.

16. Shut down tractor and remove key from ignition.

17. Remove lynch pins (A) and washers. Swing tractor arms (B) away from hitch adapter.

NOTE:
If the tractor is equipped with a quick hitch system, it is NOT necessary to remove pins (A).

18. Replace lynch pins (A) and washers in the disc mower hitch.

19. Slowly drive tractor away from disc mower.

3.9 Breaking in the Disc Mower

After attaching the disc mower to the tractor for the first time, operate the machine at low speed for 5 minutes while watching and listening FROM THE OPERATOR’S SEAT for binding or interfering parts.

⚠️ CAUTION
Before investigating an unusual sound or attempting to correct a problem, shut off tractor, engage parking brake, and remove key.

IMPORTANT:
Be especially alert until you become familiar with the sound and feel of your new disc mower.

Refer to 4.3.2 Break-In Inspections, page 115 to determine the service interval for your disc mower, and complete the scheduled break-in inspection procedures.

3.10 Engaging the Power Take-Off (PTO)

⚠️ DANGER
Be sure all bystanders are clear of the machine before engaging the PTO. Never leave tractor seat with the PTO engaged.
1. Move the disc mower up to the standing crop, and slowly engage the PTO.
2. Ensure tractor PTO is running at 1000 rpm before starting to cut.
3. Disengage the PTO when not operating the disc mower.

### 3.11 Raising and Lowering Disc Mower

#### 3.11.1 Lift Cylinders

Two hydraulic cylinders (A), one at each end of the carrier, raise or lower the disc mower when the tractor’s cylinder control lever is activated.

The lift system is equipped with a lock-out valve (B) at each cylinder which prevents the cylinder from extending or retracting due to accidental movement of the lift control. Refer to 3.1.1 Engaging Locks, page 31.

**Figure 3.56: Lift Cylinder**

#### 3.11.2 Lift Control

The disc mower lift control is not normally used to control cutting height because cutting is usually performed with the cutterbar on the ground. This control is used to raise the disc mower to clear obstacles and windrows during field operation, to adjust the disc mower height for maintenance, and to raise the disc mower for storage or for transport behind a tractor.

⚠️ **DANGER**

Be sure all bystanders are clear of the machine before raising or lowering disc mower.

Activate the cylinder control lever (A) to raise or lower the disc mower.

- Move lever **forward** to position (B) to lower the disc mower.
- Move lever **backward** to position (C) to raise the disc mower.

**IMPORTANT:**

Connect hydraulic hoses so that moving control lever (A) backward raises the disc mower. Refer to 3.7.3 Connecting Hydraulics, page 46 for more information.

**Figure 3.57: Tractor Cylinder Control Lever**
3.12 Shutdown Procedure

⚠️ CAUTION

Before leaving the tractor seat for any reason:

- Disengage the power take-off.
- Park on level ground if possible.
- Lower the disc mower fully.
- Place all controls in NEUTRAL or PARK.
- Engage the park brake.
- Stop engine and remove key from ignition.
- Wait for all movement to stop.
- Lock tractor’s shielding and closures when leaving the machine unattended.

3.13 Steering the Disc Mower

**IMPORTANT:**

Valve (A) on the steering line must be in the open position (handle in line with hose) for the steering system to operate.

Steering is controlled by the tractor’s remote hydraulic system. The hitch provides the ability to do the following:

- Move the disc mower into field position.
- Make right angle turns in either direction.
- Steer around objects on both sides.
- Perform straight-line field cutting on either side of the tractor.

1. Activate steering control lever (A) to steer the disc mower into the desired path of travel.
   - Move lever **forward** to position (B) to steer the disc mower to the right.
   - Move lever **backward** to position (C) to steer the disc mower to the left.

**IMPORTANT:**

Operate the steering control lever (A) only briefly, and return it to the NEUTRAL or OFF position as soon as the disc mower reaches the desired path of travel.

**IMPORTANT:**

Connect hydraulic hoses so that moving the steering control lever (A) backward steers the disc mower to the left and moving lever forward steers the disc mower to the right. Refer to **3.7.3 Connecting Hydraulics, page 46** for more information.
3.13.1 Operating on the Right Side of the Tractor

Follow the step below to steer the disc mower to the right side of the tractor.

1. Move steering control lever (A) forward to position (B) until the disc mower reaches the desired path of travel on the right side of the tractor.

3.13.2 Operating on the Left Side of the Tractor

Follow the step below to steer the disc mower to the left side of the tractor.
1. Move steering control lever (A) backward to position (B) until the disc mower reaches the desired path of travel on the left side of the tractor.

![Figure 3.63: Tractor Steering Control Lever](image)

### 3.13.3 Avoiding Obstacles

Follow the steps below to steer the disc mower around an obstacle.

1. Activate steering control lever (A) to steer disc mower into the desired path of travel.
   - Move lever **forward** to position (B) to steer the disc mower to the right.
   - Move lever **backward** to position (C) to steer the disc mower to the left.

![Figure 3.64: Disc Mower Steered around Obstacle](image)

![Figure 3.65: Tractor Steering Control Lever](image)
3.13.4 Turning Square Corners

The following procedure is intended as a guide for developing a turning procedure for your tractor and disc mower. Specific distances are not given due to the different steering capabilities of various tractors.

1. Steer the tractor sharply away from the crop when approaching a corner. Steer the disc mower to maintain a straight cut as the tractor moves away from the crop.

2. Ensure the disc mower cuts past where the new corner will begin, and immediately raise the disc mower until the skid shoes clear the ground. Steer the disc mower as sharply as possible away from the uncut crop.

3. Drive past the corner, and steer the tractor sharply back towards the uncut crop.

**IMPORTANT:**

Ensure that the inside tractor tire does **NOT** contact the disc mower’s hitch.

4. Position the tractor so it is straddling the last cut windrow. As the disc mower finishes turning, steer it back towards the uncut crop, align the disc mower with the crop edge, and lower disc mower to cutting height.
3.13.5 Turning 180 Degrees

NOTE:
When cutting back and forth on one side of the field, approximately 15 m (50 ft.) is required at each end of the field to make a 180 degree turn.

Figure 3.67: 180 Degree Turn

1. Steer the tractor away from the uncut crop beginning at position (A) while steering the disc mower in a straight line until it cuts through the end of the row.

2. Ensure the disc mower cuts past the end of the row, and immediately raise the disc mower until the skid shoes clear the ground. Steer the disc mower as sharply as possible away from the uncut crop.

   NOTE:
   For ease of operation, both steering control levers can be activated with one hand and held until the steering cylinder completes its stroke.

3. Proceed to position (B), and start turning the tractor back towards the uncut crop.

   IMPORTANT:
   Ensure that the inside tractor tire does NOT contact the disc mower’s hitch.

4. Continue turning towards the uncut crop as shown in positions (C) and (D) while steering the disc mower towards the outside of the turning circle. Maintain hitch-to-tire clearance throughout the turn.

5. Complete the tractor turn as shown in position (E), and position the tractor so it is straddling the last cut windrow. Align the disc mower with the edge of the uncut crop.

6. Proceed to position (F), lower disc mower to cutting height, and begin a new cut through the field.

3.14 Transporting the Disc Mower

You can transport the disc mower using a tractor in either field mode or Road Friendly Transport™ mode.
• To prepare a disc mower for towing with a tractor in field mode without using the Road Friendly Transport™ option, refer to 3.14.1 Preparing Disc Mower for Transport, page 62.

• To prepare a disc mower for towing with a tractor using the Road Friendly Transport™ option, refer to Converting from Field to Transport Mode (With Road Friendly Transport™), page 66.

**CAUTION**

- Obey all highway traffic regulations in your area when transporting on public roads. Use flashing amber lights unless prohibited by law.
- Be aware of roadside obstructions, oncoming traffic, and bridges.
- Travel at safe speeds to ensure complete machine control and stability at all times. Do NOT exceed 32 km/h (20 mph). Reduce speed for corners and slippery conditions.
- Use tractor lights and disc mower flashing amber and red taillights when transporting on roads in order to provide adequate warning to operators of other vehicles.
- Do NOT transport the disc mower on a road or highway at night or in reduced visibility conditions such as rain or fog.
- Ensure that hitch on transporting vehicle is capable of handling a 907 kg (2000 lb.) static vertical load.
- Do NOT tow with any highway-capable vehicle. Use only an agricultural tractor with a sufficient weight such that the fully loaded implement weighs no more than 1.5 times the weight of the tractor.

### 3.14.1 Preparing Disc Mower for Transport

Follow these instructions to prepare the disc mower for transport without deploying the optional Road Friendly Transport™ system.

**DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

**WARNING**

Do NOT tow unless the hitch swing cylinder is fully charged. If hitch swing cylinder is not fully charged, loss of control, injury, or death could result.

1. Connect the disc mower hitch to the tractor. Refer to 3.7 Attaching Disc Mower to the Tractor, page 41.
2. Turn the handle on jack stand (A) to raise the stand.
3. Remove pin (B) and stand (A).

![Figure 3.68: Jack in Storage Position](image-url)
4. Move jack (A) to storage position on side of hitch, align the mounting holes and secure with pin (B).

**NOTE:**
If unit is equipped with a two-point hitch, rotate the hitch stand to the storage position.

5. Raise the disc mower fully and close the lift cylinder lock-out valve by turning handle (A) to the closed position (90 degree angle to the hose). Repeat on opposite side.

6. Connect the hitch swing cylinder hoses (collars with #2) to the tractor’s hydraulic circuit (A). Refer to 3.7.3 Connecting Hydraulics, page 46.

7. Swing the disc mower completely to the left, then completely to the right. Repeat three or four times to charge the hitch swing circuit.

8. Swing the disc mower so that it is centered behind the tractor.
9. Close the hitch swing lock-out valve by turning handle (A) to the closed position (90 degree angle to the hose).

10. Ensure tires are properly inflated.

11. Ensure the slow moving vehicle (SMV) sign, reflectors, and lights are clean and visible at rear of disc mower.

12. Refer to 3.14.3 Transporting with a Tractor, page 75 for transport instructions.

3.14.2 Converting between Field and Transport Modes

Refer to the procedure that suits your equipment and desired transport mode:

- Converting from Transport to Field Mode (Without Road Friendly Transport™), page 64
- Converting from Field Mode to Transport (Without Road Friendly Transport™), page 65
- Converting from Field to Transport Mode (With Road Friendly Transport™), page 66
- Converting from Transport to Field Mode (With Road Friendly Transport™), page 72

Converting from Transport to Field Mode (Without Road Friendly Transport™)

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Stop engine and remove key from ignition.

2. Connect all hydraulic hoses (refer to 3.7.3 Connecting Hydraulics, page 46), and connect electrical wiring harness.

3. Open the steering lock-out valve by turning the handle (A) to the open position (in line with hose).
4. Open the lock-out valve (A) on each lift cylinder by turning the handle to the open position (in line with hose).

Converting from Field Mode to Transport (Without Road Friendly Transport™)

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Raise header.
2. Move header fully to the left side, then fully to the right side. Repeat this a couple of times.
3. Center the header.
4. Stop engine and remove key from ignition.
5. Close the steering lock-out valve by turning handle (A) to the closed position (90 degree angle to the hose).
6. Close the lift cylinder lock-out valve by turning handle (A) to the closed position (90 degree angle to the hose). Repeat on opposite side.

7. Disconnect all hydraulic hoses (refer to 3.7.3 Connecting Hydraulics, page 46), and disconnect electrical wiring harness.

Converting from Field to Transport Mode (With Road Friendly Transport™)

⚠️ DANGER
To prevent serious injury or death, do NOT convert the machine into, or from transport mode until all people, animals, and objects are clear of the unit’s rotational range.

⚠️ DANGER
Stop the power take-off (PTO) before converting the unit into transport mode. The cutting discs continue to spin after the drive is turned off.

⚠️ WARNING
To prevent equipment damage, ensure cutterbar doors are properly closed before converting the machine from field to transport mode.

IMPORTANT:
In some jurisdictions, having tall crop dividers installed can make the disc mower too wide for public roads when in Road Friendly Transport™ mode. If necessary, remove the dividers, and reinstall them after the machine is transported. For instructions, refer to 3.15.6 Tall Crop Divider Option, page 85.
1. Clear bystanders from the area and start tractor. Do **NOT** operate the disc mower.

2. Following the steps on the field-to-transport decal (A), move transport switch to the lower position (C) and ensure that light (B) is illuminated.

3. While light is illuminated, raise the disc mower fully by extending the field wheel cylinders.
4. Operate the hitch swing control lever to rotate the disc mower to the right until cam bearing nut is aligned with the green section of the transport alignment gauge decal.

5. Move transport switch to the upper position and ensure that the light is NOT illuminated. The hitch swing circuit is now deactivated and the transport circuit is active.

6. Operate hitch swing control lever to lower transport wheels (A) and hold lever until disc mower is lifted off the ground.

7. Continue to hold the hitch swing control lever so that the disc mower (B) rotates to the left and under the hitch.

8. Release hitch swing control lever when disc mower (C) stops rotating.
9. Operate the lift control lever to lower the disc mower onto the transport assembly, raise the field wheels, and engage transport latch onto hitch.

**IMPORTANT:**
Once latch has engaged, do **NOT** operate any hydraulic circuits.

10. Close the steering lock-out valve and the two lift cylinder lock-out valves by turning the handles to the closed position. Refer to Figure 3.84, page 69 and Figure 3.85, page 70.

**Steering lock-out:** Close the valve by turning handle (A) to the closed position (90 degree angle to the hose).
**Lift cylinder lock-out**: Close the valve by turning handle (A) to the closed position (90 degree angle to the hose). Repeat on opposite side.

11. Activate the hazard lights (A) on the disc mower. Ensure all lights are working.

12. Ensure that the slow moving vehicle sign (B) is visible from behind the disc mower.
13. Once the field to transport conversion (A) is complete, leave the switch in the upper position (C). Ensure that light (B) is **NOT** illuminated.

Figure 3.87: Remote Control
Converting from Transport to Field Mode (With Road Friendly Transport™)

⚠️ DANGER

To prevent serious injury or death, do NOT convert the machine into, or from transport mode until all people, animals, and objects are clear of the unit’s rotational range.

⚠️ WARNING

To prevent equipment damage, ensure cutterbar doors are properly closed before converting the machine from field to transport mode.

1. Following the steps on the transport-to-field decal (A), move transport switch to the upper position (C) and ensure that light (B) is NOT illuminated.

2. Open the steering lock-out valve and the two lift cylinder lock-out valves by turning the handles to the open position.

Figure 3.88: Remote Control

Figure 3.89: Hydraulic Lockout
Steering lock-out: Open the valve by turning handle (A) to the open position (in line with the hose).

Lift cylinder lock-out: Open the valve by turning handle (A) to the open position (in line with the hose). Repeat on opposite side.

3. While the light is NOT illuminated, operate the lift control lever (as if raising the disc mower) to fully extend the lift cylinders and raise the cutterbar off the transport assembly support. The carrier frame latch will automatically open.
4. Operate the hitch swing control lever to rotate the disc mower to the right. The disc mower will stop when it reaches operating position.

**NOTE:**
A sequenced movement transitions the disc mower from transport to field mode. This is accomplished by the rear transport swing cylinder, and the transport deploy cylinder. During the transition, continue to hold the hitch swing lever in the active position to allow oil to be supplied to the two cylinders sequentially.

5. Continue operating the hitch swing control lever to fully raise the transport assembly and lower the disc mower onto the field wheels.

6. Move transport switch to the lower position and ensure that the light on the remote control is illuminated. Transport conversion is now complete and the hitch swing circuit is active.
7. Once the transport-to-field conversion (A) is complete, leave the switch in lower position (C). Ensure that light (B) is illuminated.

3.14.3 Transporting with a Tractor

If towing endwise with the optional Road Friendly Transport™ system, refer to Converting from Field to Transport Mode (With Road Friendly Transport™), page 66.

1. Before transporting the disc mower with a tractor, ensure the machine is prepared for transport. Refer to 3.14.1 Preparing Disc Mower for Transport, page 62.

2. Ensure hitch safety chain is properly connected to the tractor. Provide only enough slack in chain to permit turning.

3. Move jack (A) to storage position on side of hitch, and secure with pin (B).

   NOTE:
   If unit is equipped with a two-point hitch, rotate the stand to the storage position.

4. Ensure the hydraulic hoses are securely stored on the hitch.

   NOTE:
   The primary driveline and hydraulic hoses do not need to be attached to the tractor for towing.

5. Ensure the hitch swing lock-out and the two lift-cylinder lock-out valves are closed (handle 90 degree to the hose).

   NOTE:
   Keep the slow moving vehicle (SMV) sign, reflectors, and lights clean and visible at rear of disc mower.
6. Ensure tires are properly inflated.

**IMPORTANT:**
Do **NOT** exceed 32 km/h (20 mph).

### 3.14.4 Transport Lighting

**Lighting (With Road Friendly Transport™ Option)**

The disc mower is equipped with two bidirectional amber lights (A) located on the outboard edges of the carrier frame that function as flashing hazard lights and turn signals.

The red lights (B) located on the inboard side of the amber lights function as both tail and brake lights. Refer to **3.7.4 Connecting Electrical Wiring Harness, page 47** for information about connecting the disc mower’s electrical harness to the tractor.

Amber reflective tape is applied to various locations on the front and sides of the disc mower, hitch, and carrier frame. Red reflective tape is applied to the rear of the disc mower.

![Figure 3.97: Lighting Locations (with Road Friendly Transport™)](image)

**Lighting (Without Road Friendly Transport™ Option)**

The disc mower is equipped with two bidirectional amber lights (A) located on the outboard edges of the carrier frame that function as flashing hazard lights and turn signals.

The red lights (B) located on the inboard side of the amber lights function as both tail and brake lights. Refer to **3.7.4 Connecting Electrical Wiring Harness, page 47** for information about connecting the disc mower’s electrical harness to the tractor.

Amber reflective tape is applied to various locations on the front and sides of the disc mower, hitch, and carrier frame. Red reflective tape is applied to various locations on the disc mower.

![Figure 3.98: Lighting Locations](image)
3.15 Operating the Disc Mower

Operating the disc mower properly results in less crop lost and increased productivity during harvest. This includes making proper adjustments while operating the machine to suit various crops and harvest conditions. Regular maintenance and operating the machine safely and properly increases the machine’s length of service.

The variables listed in Table 3.8, page 77 and detailed on the following pages will affect the performance of your disc mower. You will quickly become adept at adjusting your machine to produce the desired results. Although most of the adjustments have been set at the factory, settings can be changed to suit your crop conditions.

<table>

</tbody>
</table>

3.15.1 Float

Disc mower float springs are normally set so a force of approximately 43–47 kg (95–105 lb.) is required to lift either end of the disc mower just off the ground when the hitch is centered.

In rough or stony conditions, it may be preferable to apply less force in order to protect cutting components.

**NOTE:**
When float setting is light, it may be necessary to reduce ground speed to prevent excessive bouncing and leaving a ragged cut.

*Adjusting Disc Mower Float*

The float setting (or lifting force) changes depending on the conditioner type and options. The setting must be equal at both ends of the disc mower.

**DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

**NOTE:**
Changes to the disc mower operating position can affect the float settings. After adjusting the cutting height or the cutting angle, check float and adjust as necessary.
1. Center the disc mower directly behind the tractor and set the cutterbar to an orientation and tilt appropriate for the crop type and cutting conditions. Refer to 3.15.3 Cutterbar Angle, page 81.

   NOTE:
   Ensure skid shoes are in correct position before setting disc mower angle, float, and tilt.

2. Raise the disc mower fully. Shut off the engine, and remove the key.
3. Close lift cylinder lock-out valve (A) on each lift cylinder by turning the handle to the closed position (90 degree angle to the hose).
4. Loosen jam nut (B) away from the spring.
5. Turn adjuster bolt (C) to achieve the recommended measurement (D) for the conditioner type. Refer to Table 3.9, page 79.
   - Turn bolt clockwise (towards spring) to increase float.
   - Turn bolt counterclockwise (away from spring) to decrease float.
6. Tighten jam nut (B) against spring.
7. Measure the length of exposed thread (D) on the float spring tension bolts.

**NOTE:**
Float settings indicated in the table at right are starting point settings only. Float force should still be checked with disc mower float and cutting angle set as planned for use in the field.

8. Repeat Steps 4, page 78 to 7, page 79 on the opposite side of the disc mower.

9. Open lift cylinder lock-out valve (A) on each lift cylinder by turning the handle to the open position (in line with the hose).

10. To check float, lower the disc mower to cutting position, grasp the front corner of mower, and lift; the weight should feel like approximately 45 kg (100 lb.) at both ends.

11. Repeat adjustment procedures until the desired weight is achieved at both ends of the disc mower.

### 3.15.2 Cutting Height

Cutting height is determined by a combination of the disc mower angle and skid shoe settings. Adjust cutting height for optimum cutting performance while preventing excessive build-up of mud and soil inside the disc mower, which can lead to poor crop flow and increased wear on cutting components.

Lowering the skid shoes and decreasing the disc mower angle increases the cutting height, resulting in higher stubble that helps material dry faster. This may be desirable in stony conditions to help reduce damage to cutting components.

Raising the skid shoes and increasing the disc mower angle decreases the cutting height, resulting in a shorter stubble. Refer to *Adjusting Cutting Height, page 80*.

To choose a disc mower angle that maximizes performance for your crop and field conditions, refer to **3.15.3 Cutterbar Angle, page 81**.

To minimize cutterbar damage, scooping soil, and soil build-up at the cutterbar in damp conditions, the disc mower float should be set as light as possible without causing excessive bouncing. Refer to *Adjusting Disc Mower Float, page 77*. 

Adjusting Cutting Height

DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

1. Raise disc mower fully, stop engine, and remove key. Engage lift cylinder lock-out valves.
2. Loosen bolts (C).
3. Remove bolts, nuts, and washers (D).
4. Raise or lower skid shoe.
   
   NOTE:
   Skid shoes have two adjustment settings: fully raised (A) and fully lowered (B).
5. Install bolts, nuts, and washers (D), and then tighten.
6. Tighten bolts (C).
   
   NOTE:
   • One skid shoe per side for 4.0 m (13 ft.) disc mowers.
   • Two skid shoes per side for 4.9 m (16 ft.) disc mowers.
7. Check disc mower float. Refer to Adjusting Disc Mower Float, page 77.
8. Adjust cutterbar angle to desired working position using the disc mower angle controls. If angle is not critical, set it to mid-position. Refer to 3.15.3 Cutterbar Angle, page 81.
3.15.3 Cutterbar Angle

The header angle (A) adjustment ranges from 0 to 5 degrees below horizontal using the mechanical center-link and from 0 to 7 degrees below horizontal using the hydraulic center-link.

Choose an angle that maximizes performance for your crop and field conditions. A flatter angle provides better clearance in stony conditions, whereas a steeper angle is required in downed crops for better lifting action.

**NOTE:**
In most cases, cut quality is improved by keeping the cutterbar angle as close to 0 degrees as possible.

---

**Adjusting Cutterbar Angle: Mechanical Center-Link**

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator's seat for any reason.

1. Lower disc mower so cutterbar is resting on the ground.
2. Loosen nut (A).
3. Decrease (flatten) cutterbar angle by rotating the turnbuckle sleeve (B) to decrease the turnbuckle length.
4. Increase (steepen) cutterbar angle by rotating the turnbuckle sleeve (B) to increase the turnbuckle length.
5. Tighten nut (A) but do **NOT** overtighten. A slight tap with a small hammer is sufficient.
6. Check cutting height and adjust if required.
7. Check disc mower float and adjust if required. Refer to **3.15.1 Float, page 77**.

---

**Adjusting Cutterbar Angle: Hydraulic Center-Link**

**NOTE:**
The cutterbar angle can be adjusted from the tractor without shutting down the disc mower.
1. Decrease (flatten) cutterbar angle by operating the tractor hydraulic control so that cylinder (C) retracts and moves gauge (D) toward the green zone (A).

2. Increase (steepen) cutterbar angle by operating the tractor hydraulic control so that cylinder (C) extends and moves gauge (D) toward the red zone (B).

3.15.4 Ground Speed

Choose a ground speed that allows the cutterbar to cut the crop smoothly and evenly. Try different combinations of disc mower speed and ground speed to suit your specific crop. Refer to your tractor operator’s manual for instructions on changing ground speed.

⚠️ CAUTION

Reduce speed when turning, crossing slopes, or traveling over rough ground.

In tough cutting conditions (such as native grasses), set the disc speed to MAXIMUM.

In light crops, reduce the disc mower’s disc speed while maintaining ground speed.

NOTE:

Operating the disc mower at the minimum disc speed will extend the wear life of cutting components.

The example shown in Figure 3.105, page 83 illustrates the relationship between ground speed and cut area for a 4.0 m (13 ft.) disc mower. The chart demonstrates that a ground speed of 21 km/h (13 mph) would produce a cut area of approximately 8 hectares (20 acres) per hour.
Figure 3.105: Ground Speed for 4.0 m (13 ft.) Disc Mower

A - Acres/Hour
B - Hectares/Hour
C - Kilometers/Hour
D - Miles/Hour
3.15.5 Cutterbar Deflectors

Cutterbar deflectors attach to the cutterbar just below the header’s conditioner rolls. Deflectors provide improved feeding into the conditioner rolls and prevent heavy crop with long stems from feeding under the rolls.

Cutterbar deflectors may not be well-suited for some crop and field conditions. Refer to the following table:

Table 3.10 Conditions for Using Cutterbar Deflectors

<table>
<thead>
<tr>
<th>Crop/Field Condition</th>
<th>Use Deflector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average crop/normal field conditions</td>
<td>Yes</td>
</tr>
<tr>
<td>Long stemmed and heavy/normal field conditions</td>
<td>Yes</td>
</tr>
<tr>
<td>Long stemmed and heavy/sandy soil</td>
<td>No</td>
</tr>
<tr>
<td>Long stemmed and heavy/gopher mounds or rocks (refer to note below table)</td>
<td>No</td>
</tr>
<tr>
<td>Using finger conditioner</td>
<td>No</td>
</tr>
</tbody>
</table>

NOTE:
Removing the deflector helps feed dirt/rocks through the header and prevents debris build up, wear and damage from rocks.

Removing Cutterbar Deflectors

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

IMPORTANT:
To avoid damage, cutterbar deflectors must NOT be used with the finger conditioner option.

1. Raise mower fully, shut down tractor, and remove key from ignition.
3. Clean debris from deflectors and deflector area.

IMPORTANT:
Do NOT remove cutterbar level plug (B).
4. Remove three bolts and nuts (C) securing deflector to cutterbar using a 6 mm hex key and a 15 mm socket.
5. Remove bolt (D) from outboard end of deflector with 8 mm hex key. Retain bolt.
6. Remove deflector (A). Replace retained bolt (D) through skid shoe and secure with M12 washer and lock nut (E).
7. Repeat for deflector on opposite side of disc mower.
8. Store deflectors and hardware in a safe place.
Installing Cutterbar Deflectors

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

**IMPORTANT:**

To avoid damage, cutterbar deflectors must **NOT** be used with the finger conditioner option.

1. Raise disc mower fully, shut down tractor, and remove key from ignition.
2. Close lift cylinder lock-out valves.
3. Clean debris from ledge and the six mounting holes along aft edge of cutterbar.
4. Position left deflector (A) (with cut-out for cutterbar drain plug [B]) on top of ledge along the outboard end of the cutterbar, and align existing fasteners and cutterbar plug with slots in deflector (A).
5. Install three button hex head socket M10 bolts (C) with lock nuts in the holes with the heads facing down.

6. Repeat Steps 3, page 85 through Step 5, page 85 to install right deflector (A).
7. Align deflectors at position (B) and tighten bolts (C) to 54 Nm (40 lbf·ft) with a 16 mm socket and an 8 mm hex key.

---

**3.15.6 Tall Crop Divider Option**

Tall crop dividers (one on each end of the disc mower) help divide tall crops cleanly, and improve crop flow to the cutterbar. Tall crop dividers are not adjustable, but they are removable.
Installing Tall Crop Divider

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

IMPORTANT:
In some jurisdictions, having tall crop dividers installed can make the disc mower too wide for public roads when in Road Friendly Transport™ mode. If necessary, install the dividers after the machine is transported.

1. Lower the disc mower fully.
2. Shut down the tractor and disc mower and remove key.
3. Open cutterbar doors. For instructions, refer to 3.3.1 Opening Cutterbar Doors, page 36.
4. Remove three bolts (A) and nuts where the divider (B) will be mounted.
5. Position the divider (B) on disc mower, and reinstall three bolts (A) and nuts. Tighten nuts.
6. Repeat for opposite side.
7. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

Removing Tall Crop Divider

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving Operator’s seat for any reason.
1. Lower disc mower fully, shut down tractor and disc mower, and remove key.

2. Open cutterbar doors. For instructions, refer to 3.3.1 Opening Cutterbar Doors, page 36.

3. Remove three bolts (A), and remove deflector (B).

4. Reinstall three bolts (A).

5. Repeat for opposite side.

6. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.
3.16 Conditioning: Roll Type

Rolls condition the crop by crimping and crushing the stem in several places allowing the release of moisture, resulting in faster drying times. Both steel and polyurethane conditioner rolls are available.

3.16.1 Roll Gap

The roll gap controls the degree to which crop is conditioned as it passes through the rolls. Roll gap is factory-set at approximately 3 mm (1/8 in.) for polyurethane rolls, and 6 mm (1/4 in.) for steel rolls.

Polyurethane rolls are better suited for crushing stems while providing reduced crimping and are recommended for alfalfa, clover, legumes, and similar crops. Correct conditioning of crops is achieved when 90% of the stems show cracking, but no more than 5% of the leaves are damaged. Set roll gap to produce these results.

Steel rolls with a larger gap (up to 25 mm [1 in.]) may be desirable for thick stemmed cane-type crops; however, too large a gap may cause feeding problems.

Grass type crops may require less gap for proper feeding and conditioning.

IMPORTANT:
If using settings below the factory setting, visually inspect the roll gap.

Checking Roll Gap

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator's seat for any reason.

1. Lower the disc mower fully.
2. Stop engine, and remove key from ignition.
3. **Polyurethane Roll:** Insert a feeler gauge through the inspection hole in the conditioner endsheet to check roll gap on polyurethane roll conditioners. Factory setting is 3 mm (1/8 in.). If adjustments are required, refer to *Adjusting Roll Gap (Polyurethane Rolls), page 90.*
4. **Steel Roll**: The length of thread (A) extending above the jam nut on the adjustment rods can be used as an approximation of roll gap but does **NOT** provide consistent roll gap measurements. Roll gap factory setting is 6 mm (1/4 in.). Refer to *Adjusting Roll Gap (Steel Rolls), page 91.*
Adjusting Roll Gap (Polyurethane Rolls)

Because polyurethane rolls operate at smaller gaps and the conditioning is less aggressive, the roll gap setting is more sensitive than on steel rolls. To return roll gap to the factory setting, follow the procedure below:

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the disc mower to the ground.
2. Stop the engine, and remove the key from the ignition.
3. Loosen upper jam nut (A) on both sides of conditioner.
4. Turn lower nut (B) counterclockwise until upper roll rests on lower roll.
5. Turn lower nut (B) one full turn clockwise to raise the upper roll and achieve a 3 mm (1/8 in.) roll gap.
6. Hold nut (B) and tighten jam nut (A) on both sides of the header.

**IMPORTANT:**
Make sure roll gap adjustment nuts are adjusted equally on both sides of the header to achieve a consistent gap across the rolls.

7. Rotate the rolls manually and use a feeler gauge at the ends of the rolls to check that the actual gap is no less than 2 mm (5/64 in.) and no more than 4 mm (5/32 in.).
Adjusting Roll Gap (Steel Rolls)

The length of thread extending above the jam nut on the adjustment rods can be used as an approximation of roll gap but does NOT provide consistent roll gap measurements. To ensure roll gap is at the factory setting, follow the procedure below:

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the disc mower to the ground.
2. Stop the engine, and remove the key from the ignition.
3. Loosen jam nut (A) on both sides of conditioner.
4. Turn lower nut (B) counterclockwise until upper roll rests on lower roll. Ensure rolls intermesh.
5. Turn lower nut (B) two and a half full turns clockwise to raise upper roll and achieve a 6 mm (1/4 in.) roll gap.
6. Hold nut (B) and tighten jam nut (A) on both sides of the header.

IMPORTANT:
Make sure roll gap adjustment nuts are adjusted equally on both sides of the header to achieve a consistent gap across the rolls.

7. If further adjustment to roll gap is required:
   - Turn lower nut (B) clockwise to increase roll gap.
   - Turn lower nut (B) counterclockwise to decrease roll gap.

NOTE:
Make further adjustments to roll gap based on header performance and crop conditions.
3.16.2 Roll Tension

Roll tension (the pressure holding the rolls together) is factory-set to maximum and is adjustable.

Heavy crops or tough forage can cause the rolls to separate; therefore, maximum roll tension is required to ensure that materials are sufficiently crimped.

To prevent over-conditioning of light alfalfa and short grasses, apply less roll tension.

Adjusting Roll Tension

To adjust roll tension, follow these steps:

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator's seat for any reason.

1. Lower the disc mower to the ground.
2. Stop the engine, and remove the key from the ignition.
3. Loosen jam nut (A) on both sides of conditioner.
4. Turn the spring drawbolt (B) clockwise to tighten spring (C) and **INCREASE** roll tension.
5. Turn the spring drawbolt (B) counterclockwise to loosen spring (C) and **DECREASE** roll tension.
6. Measure the amount of exposed thread on spring drawbolt (B) at each end of the conditioner. Measurement (D) should be 12–15 mm (1/2–9/16 in.) for both polyurethane and steel roll conditioners.

**IMPORTANT:**

Turn each bolt equally. Each turn of the bolt changes the roll tension by approximately 32 N (7.2 lbf).

7. Tighten jam nuts (A) on each end of the conditioner.

![Figure 3.117: Left Side Shown – Right Side Opposite](image)
3.16.3 Roll Timing

For proper conditioning, the rolls must be properly timed with the bar on one roll centered between two bars on the other roll. The factory setting should be suitable for most crop conditions.

IMPORTANT:
Roll timing is critical when the roll gap is decreased because conditioning is affected and the bars may contact each other.

Checking Roll Timing

Check roll timing if excessive noise is coming from the conditioner rolls.

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

Roll timing is factory-set and should not require adjustment; however, if there is excessive noise coming from the conditioner rolls, the timing will need to be adjusted. Refer to Adjusting Roll Timing, page 93.

Adjusting Roll Timing

1. Shut down the engine and remove the key.
2. Loosen four bolts (A) in slots of yoke plate (B) on upper roll universal shaft.

   NOTE:
   Only three of the four bolts are shown in the illustration.

4. Manually rotate upper roll (B) in a counterclockwise direction until it stops.

5. Make a mark (C) across yoke (D) and gearbox flange (E).

6. Manually rotate upper roll (A) in a clockwise direction until it stops. Make a second mark (B) on the yoke flange, and align it with the mark on the gearbox flange.
7. Determine the center point (A) between the two marks on the yoke plate, and place a third mark.

8. Rotate upper roll (B) in the counterclockwise direction until the bolt lines up with the third (center) mark.

9. Ensure threads on four bolts (A) are clean and free of lubricant (fourth bolt not shown in illustration at right).

10. Apply medium-strength threadlocker (Loctite® 242 or equivalent), and tighten bolts (A). Torque to 95 Nm (70 lbf·ft).

3.16.4 Adjusting Forming Shields: Roll Conditioner

⚠️ WARNING

Keep everyone several hundred feet away from your operation. Ensure bystanders are never in line with the front or rear of the machine. Stones or other foreign objects can be ejected from either end with force.

The position of the forming shields controls the width and placement of the windrow. Consider the following factors when setting the forming shield position:

- Weather conditions (rain, sun, humidity, wind)
- Type and yield of crop
- Available drying time
• Method of processing (bales, silage, green-feed)

A wider windrow will generally dry faster and more evenly, resulting in less protein loss. Fast drying is especially important in areas where the weather allows only a few days to cut and bale. A narrower windrow may be preferable for ease of pick-up and when drying is not critical (for example, when cutting for silage or green-feed).

**Positioning Forming Shield Side Deflectors: Roll Conditioner**

The position of the side deflectors controls the width and placement of the windrow. To ensure windrow placement is centered between the carrier wheels, adjust left and right side deflectors to the same position.

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Loosen the locking handle (A).
2. Slide the adjuster bar (B) along adjuster plate (C) to the desired deflector position and engage the bar (B) into a notch in the adjuster plate.
3. Tighten locking handle (A).
4. Repeat for other side.

![Figure 3.124: Side Deflector and Adjuster Bar](image)
Positioning Rear Baffle: Roll Conditioner

The rear baffle is used in conjunction with the forming shields to affect the width of the windrow. It is located immediately behind and above the conditioning rolls and can be positioned to do the following:

- Direct crop flow into forming shield for narrow and moderate width windrows.
- Direct crop downward to form a wide swath.

To position rear baffle, follow these steps:

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator's seat for any reason.

1. Remove lynch pin (A) securing rear baffle adjustment lever (B) to bracket (C).
2. Pull rear baffle adjustment lever (B) in inboard direction to disengage from bracket (C).
3. Position rear baffle adjustment lever (B) as follows:
   - Move lever forward to raise baffle
   - Move lever backward to lower baffle
4. Release rear baffle adjustment lever (B) so that tab engages hole in bracket (C).
5. Secure baffle adjustment lever (B) with lynch pin (A).

3.17 Conditioning: Finger Type

The finger type conditioner is most commonly used to harvest grass crops. The finger type rotor moves the crop across the conditioning baffle which strips away the waxy coating from the plants.

The degree to which the crop is conditioned as it passes through the conditioner is controlled by the clearance between the fingers and the internal intensity baffle and by the rotational speed of the fingers (refer to Changing Finger Rotor Speed, page 98).
3.17.1 Internal Intensity Baffle

Conditioning intensity is controlled by adjusting clearance (X) between the finger rotor and the baffle.

There are seven clearance settings from 8 to 71 mm (5/16 to 2-3/4 in.).

The baffle is located in front of and above the finger rotor. Set clearance depending on crop volume and the desired level of conditioning:

- Use the highest clearance setting for lighter conditioning in heavy crops
- Use the lowest clearance setting for maximum conditioning in average crops

Figure 3.126: Internal Intensity Baffle

Adjusting Internal Intensity Baffle Clearance

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Pull internal intensity baffle adjustment lever (A) outboard to disengage tab from adjustment plate (B).
2. Move lever (A) forward to lower baffle and decrease clearance.
3. Move lever (A) rearward to raise baffle and increase clearance.
4. Release internal intensity baffle adjustment lever (A) so that tab engages hole in adjustment plate (B).

Figure 3.127: Internal Intensity Baffle Adjustment Lever

3.17.2 Finger Rotor Speed

The finger rotor is set to 900 rpm at the factory, but it can be changed to 600 rpm depending on crop conditions, crop volume, and the desired amount of conditioning.

In sensitive crops, 600 rpm may be a suitable speed to minimize crop damage. In light crops and dry grasses, 900 rpm may be a more effective speed. At 900 rpm, crop damage can occur and power consumption will increase.

Changing Finger Rotor Speed

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.
NOTE:
For 900 rpm, mount the larger pulley on the conditioner roll timing gearbox, and the smaller pulley to the input shaft on the conditioner assembly.
For 600 rpm, mount the smaller pulley on the conditioner roll timing gearbox, and the larger pulley to the input shaft on the conditioner assembly.

1. Turn jam nut (A) counterclockwise to unlock tension adjustment.
2. Turn jam nut (A) and adjuster nut (B) counterclockwise to fully collapse tensioner spring (C) and release the tension from conditioner drive belt (D).
3. Remove drive belt (D).

4. Measure and record the distance from the shaft end to the taper lock bushing face (A) on both pulleys.
5. Remove three bolts (B) and insert them into the three threaded bores.
6. Apply uniform pressure to the taper lock bushing by slightly tightening each bolt in a circular pattern until the taper lock bushing comes free.
8. Swap the pulleys.
9. Slip the taper lock bushing (A) onto the shaft at the same depth measurement recorded in Step 4, page 99. Pulley will be drawn into taper lock when tightening.

10. Repeat Step 9, page 100 for the second pulley.

11. Verify pulley face alignment by using a long, verified straight edge, and bridge both faces to a tolerance of 5 mm (3/16 in.).

12. Install drive belt (A).

13. Remove jam nut (B).

14. Turn adjuster nut (C) to remove all slack from tensioner.
15. Measure the length of tensioner spring (A), and turn adjuster nut (B) to adjust spring length to 36.5 cm (14-3/8 in.) to conform with spring tension decal (C).

16. Install jam nut (A).

17. Hold a wrench on adjuster nut (B) and turn jam nut (A) clockwise into adjuster nut to lock tension adjustment.

18. Verify that pulleys run true and if any of the pulleys wobble, proceed to Step 1, page 99 and repeat procedure to reinstall taper locks on the affected pulleys.

### 3.17.3 Forming Shields: Finger Conditioner

The position of the forming shields controls the width and placement of the windrow. Decide which forming shield position to use based on the following factors:
• Weather conditions (rain, sun, humidity, wind)
• Type and yield of crop
• Available drying time
• Method of processing (bales, silage, green-feed)

A wider windrow will generally dry faster and more evenly, resulting in less protein loss. Fast drying is especially important in areas where the weather allows only a few days to cut and bale. For more information, refer to 3.18 Haying Tips, page 103.

A narrower windrow may be preferable for ease of pick-up and when drying is not critical (for example, when cutting for silage or green-feed).

**Positioning Side Deflectors: Finger Conditioner**

The position of the side deflectors controls the width and placement of the windrow. To ensure windrow placement is centered between the carrier wheels, adjust both side deflectors to the same position.

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Loosen handle (A) on top cover.
2. Move side deflector (B) to desired position.
3. Tighten the handle.
4. Repeat for other side.

![Figure 3.134: Right Side Shown – Left Side Opposite](image_url)
Positioning Rear Baffle: Finger Conditioner

The rear baffle (A) is located immediately behind and above the finger conditioner. The baffle (A) can be used to direct crop into the forming shields for narrow and moderate width windrows or to direct crop downward to form a wide swath.

![Figure 3.135: Rear Baffle Finger Conditioner](image)

**DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

To adjust the position of the rear baffle, follow these steps:

1. Pull rear baffle adjustment lever (A) outboard to disengage tab from adjustment plate (B).
2. Position rear baffle adjustment lever (A) as follows:
   a. To raise baffle, move lever forward.
   b. To lower baffle, move lever backward.
3. Release rear baffle adjustment lever (A) so that tab engages hole in adjustment plate (B).

![Figure 3.136: Rear Baffle Adjustment Lever](image)

### 3.18 Haying Tips

#### 3.18.1 Curing

Curing crops quickly helps maintain the highest quality of crop material as 5% of protein is lost from hay for each day that it lays on the ground after cutting.

Leaving the windrow as wide and fluffy as possible results in the quickest curing. Cured hay should be baled as soon as possible.
3.18.2 Topsoil Moisture

Table 3.11 Topsoil Moisture Levels

<table>
<thead>
<tr>
<th>Level</th>
<th>% Moisture</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wet</td>
<td>Over 45%</td>
<td>Soil is muddy</td>
</tr>
<tr>
<td>Damp</td>
<td>25–45%</td>
<td>Shows footprints</td>
</tr>
<tr>
<td>Dry</td>
<td>Under 25%</td>
<td>Surface is dusty</td>
</tr>
</tbody>
</table>

- On wet soil, the general rule of wide and thin does not apply. A narrower windrow will dry faster than hay left flat on wet ground.
- When the ground is wetter than the hay, moisture from the soil is absorbed by the hay above it. Determine topsoil moisture level before cutting. Use a moisture tester or estimate level.
- If ground is wet due to irrigation, wait until soil moisture drops below 45%.
- If ground is wet due to frequent rains, cut hay when weather allows and let the forage lie on wet ground until it dries to the moisture level of the ground.
- Cut hay will dry only to the moisture level of the ground beneath it, so consider moving the windrow to drier ground.

3.18.3 Weather and Topography

- Cut as much hay as possible by midday when drying conditions are best.
- Slopes that face the sun receive up to 100% more exposure to the sun’s heat than slopes that do not face the sun. If hay is baled and chopped, consider baling sun facing slopes and chopping slopes that do not.
- When relative humidity is high, the evaporation rate is low and hay dries slowly.
- Humid air is trapped around the windrow in calm conditions. Raking or tedding will expose the hay to fresher and drier air.
- Cut hay perpendicular to the direction of the prevailing winds if possible.
3.18.4 Windrow Characteristics

Producing windrows with the recommended characteristics will achieve the best results. Refer to 3.15 Operating the Disc Mower, page 77 for instructions on adjusting the pull-type disc mower.

Table 3.12 Recommended Windrow Characteristics

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Advantage</th>
</tr>
</thead>
<tbody>
<tr>
<td>High and fluffy</td>
<td>Enables airflow through windrow, which is more important to the curing process than direct sunlight</td>
</tr>
<tr>
<td>Consistent formation (not bunching)</td>
<td>Permits an even flow of material into the baler, chopper, etc.</td>
</tr>
<tr>
<td>Even distribution of material across windrow</td>
<td>Results in even and consistent bales to minimize handling and stacking problems</td>
</tr>
<tr>
<td>Properly conditioned</td>
<td>Prevents excessive leaf damage</td>
</tr>
</tbody>
</table>

3.18.5 Driving on Windrow

Driving on previously cut windrows that will not be raked can lengthen drying time by a full day. If practical, set forming shields to produce a narrower windrow that the machine can straddle.

**NOTE:**
Driving on the windrow in high-yield crops may be unavoidable if a full width windrow is necessary.

3.18.6 Raking and Tedding

Raking or tedding speeds up drying; however, the resulting leaf loss may outweigh the benefits. There is little or no advantage to raking or tedding if the ground beneath the windrow is dry.

Large windrows on damp or wet ground should be turned over when moisture levels reach 40–50%. Hay should not be raked or tedded at moisture levels below 25% or excessive yield loss will result.

3.18.7 Using Chemical Drying Agents

Hay drying agents work by removing wax from legume surfaces and allowing moisture to escape cut crop and evaporate faster; however, treated hay lying on wet ground will absorb ground moisture faster.

Before deciding to use a drying agent, carefully compare the relative costs and benefits for your area.

3.19 Checking Level of the Disc Mower

The support linkages are factory-set to provide the proper level for the disc mower and should not normally require adjustment. The float springs are NOT used to level the disc mower.

If the disc mower is NOT level, check the tire pressure and ensure proper inflation. Refer to Inflating Tires, page 251.

Component damage in the disc mower support system may occur if the disc mower cannot be leveled. Contact your MacDon Dealer.
3.20 Unplugging the Disc Mower

The cutterbar or the conditioner rolls (if installed) can get plugged with crop. Do the following steps to safely unplug the cutterbar:

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop tractor engine and remove key before removing plugged material from disc mower.

1. Stop forward movement of the tractor and stop the power take-off (PTO).
2. Raise the disc mower fully, shut down the tractor engine, and remove the key.

⚠️ WARNING

Wear heavy gloves when working around cutterbar.

4. Open cutterbar doors. For instructions, refer to 3.3.1 Opening Cutterbar Doors, page 36.

5. Clean off cutterbar or rolls by hand.
6. Close cutterbar doors. For instructions, refer to 3.3.3 Closing Cutterbar Doors, page 38.
Chapter 4: Maintenance and Servicing

The following instructions provide information about routine servicing for the disc mower. A parts catalog is located in a plastic case at the right end of the disc mower.

Log hours of operation and use the maintenance record provided (refer to 4.3.1 Maintenance Schedule/Record, page 112) to keep track of your scheduled maintenance.

4.1 Recommended Safety Procedures

- Park on level surface when possible. Securely block wheels if disc mower is parked on an incline. Follow all recommendations in your tractor operator's manual.

- Wear close-fitting clothing and cover long hair. Never wear dangling items such as scarves or bracelets.

- Wear protective shoes with slip-resistant soles, a hard hat, protective glasses or goggles, and heavy gloves.

Figure 4.1: Safety Around Equipment

Figure 4.2: Safety Equipment
MAINTENANCE AND SERVICING

- Be aware that if more than one person is servicing the machine at the same time, rotating a driveline or other mechanically driven component by hand (for example, to access a lube fitting) will cause drive components in other areas (belts, pulleys, and discs) to move. Stay clear of driven components at all times.

- Be prepared if an accident should occur. Know where the first aid kits and fire extinguishers are located, and know how to use them.

- Keep the service area clean and dry. Wet or oily floors are slippery. Wet spots can be dangerous when working with electrical equipment. Be sure all electrical outlets and tools are properly grounded.

- Use adequate light for the job at hand.
- Replace all shields removed or opened for service.
- Use only service and repair parts made or approved by the equipment manufacturer. Substituted parts may not meet strength, design, or safety requirements.
- Keep machinery clean. Never use gasoline, naphtha, or any volatile material for cleaning purposes. These materials may be toxic and/or flammable.
4.2 Preparing Machine for Servicing

⚠️ CAUTION
To avoid personal injury, perform the following procedures before servicing disc mower or opening drive covers:

1. Lower the disc mower fully. If you need to perform service in the raised position, always close lift cylinder lock-out valves. For instructions, refer to 3.1 Lift Cylinder Lock-Out Valves, page 31.

2. Disengage power take-off (PTO).

3. Stop engine and remove key.

4. Engage park brake.

5. Wait for all moving parts to stop.

4.3 Maintenance Requirements

IMPORTANT:
Recommended intervals are for average conditions. Service the machine more often if operating under adverse conditions (severe dust, extra heavy loads, etc.).

Regular maintenance is the best insurance against early wear and untimely breakdowns. Following the maintenance schedule will increase your machine’s life. Periodic maintenance requirements are organized according to service intervals.

If more than one interval is specified for a service item (e.g., 100 hours or annually), service the machine at whichever interval is reached first.

When servicing the machine, refer to the specific headings in this section. Refer to this manual’s inside back cover and use only the specified fluids and lubricants.

Log hours of operation, use the maintenance record, and keep copies of your maintenance records. Refer to 4.3.1 Maintenance Schedule/Record, page 112.

⚠️ CAUTION
Carefully follow all safety messages. Refer to 4.1 Recommended Safety Procedures, page 109.
4.3.1 Maintenance Schedule/Record

Keep a record of maintenance as evidence of a properly maintained machine. Daily maintenance records are not required to meet normal warranty conditions.

First use
Refer to 4.3.2 Break-In Inspections, page 115.

End of season
Refer to 4.3.4 End-of-Season Servicing, page 116.

First Hour

✓ Check for loose hardware. Refer to 7.1 Torque Specifications, page 285.

✓ Check clutch operation and slippage. Refer to Checking Clutch Operation, page 222.

First 5 Hours

✓ Check for loose hardware. Refer to 7.1 Torque Specifications, page 285.

✓ Check conditioner drive belt tension. Refer to Inspecting Conditioner Drive Belt, page 234.

First 10 Hours, Then Daily

✓ Check hydraulic hoses and lines. Refer to 4.6.1 Checking Hydraulic Hoses and Lines, page 252.

✓ Check cutterbar discs. Refer to Inspecting Cutterbar Discs, page 139.

✓ Check cutterbar disc blades. Refer to Inspecting Disc Blades, page 153.

✓ Check cutterbar drums. Refer to Inspecting Large Drums, page 180.

First 25 Hours

✓ Check conditioner drive belt tension. Refer to Inspecting Conditioner Drive Belt, page 234.

▲ Change conditioner roll timing gearbox oil. Refer to Checking and Changing Conditioner Roll Timing Gearbox Oil, page 239.

### 4.3.3  Preseason Servicing

**CAUTION**

- Review the operator's manual to refresh your memory on safety and operating recommendations.
- Review all safety signs and other decals on the disc mower and note hazard areas.
- Ensure all shields and guards are properly installed and secured. Never alter or remove safety equipment.
- Make certain you understand and have practiced safe use of all controls. Know the capacity and the operating characteristics of the machine.
- Check the first aid kit and fire extinguisher. Know where they are and how to use them.

Perform the following procedures at the beginning of each operating season:
MAINTENANCE AND SERVICING

1. Lubricate machine completely. Refer to 4.3.5 Lubricating the Disc Mower, page 116 and 4.4.3 Lubricating Cutterbar, page 133.

2. Check tire pressure and adjust as required. Refer to Inflating Tires, page 251.

3. Perform all annual maintenance. Refer to 4.3.1 Maintenance Schedule/Record, page 112.

4.3.4 End-of-Season Servicing

⚠️ CAUTION
Never use gasoline, naphtha, or any volatile material for cleaning purposes. These materials may be toxic and/or flammable.

⚠️ CAUTION
Cover cutterbar to prevent injury from accidental contact.

Perform the following procedures at the end of each operating season:

1. Raise the disc mower and engage lift cylinder lock-out valves.

2. Clean the disc mower thoroughly.

3. Check for worn components and repair as necessary.

4. Check for broken components and order replacements from your Dealer. Immediate repair of these items will save time and effort at beginning of next season.

5. Replace or tighten any missing or loose hardware. Refer to 7.1 Torque Specifications, page 285.

6. Lubricate the disc mower thoroughly leaving excess grease on fittings to keep moisture out of bearings.

7. Apply grease to exposed threads, cylinder rods, and sliding surfaces of components.

8. Oil cutterbar components to prevent rust.

9. Loosen drive belt.

10. Remove divider rods (if equipped) to reduce space required for inside storage.

11. Repaint all worn or chipped painted surfaces to prevent rust.

12. Store in a dry, protected place if possible. If stored outside, always cover disc mower with a waterproof canvas or other protective material.

13. Use blocks to take the weight off the disc mower’s tires if possible.

4.3.5 Lubricating the Disc Mower

⚠️ WARNING
To avoid personal injury, before servicing disc mower or opening drive covers, refer to 4.2 Preparing Machine for Servicing, page 111.
Greasing points are marked on the machine by decals showing a grease gun and the grease interval in hours of operation.

Log hours of operation and use the maintenance schedule provided to keep a record of scheduled maintenance. Refer to 4.3.1 Maintenance Schedule/Record, page 112.

Greasing Procedure

Only use clean, high temperature, extreme pressure grease. Refer to this manual’s inside back cover for a list of recommended fluids and lubricants.

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Open driveshields at the ends of the disc mower to access greasing points. Refer to 3.2.1 Opening Driveshields, page 33.

2. Wipe grease fitting with a clean cloth before greasing to avoid injecting dirt and grit.

3. Replace any loose or broken fittings immediately.

4. Inject grease through fitting with grease gun until grease overflows fitting (except where noted).

5. Leave excess grease on fitting to keep out dirt.

6. Remove and thoroughly clean any fitting that will not take grease and clean lubricant passageway. Replace fitting if necessary.

Service Intervals

NOTE:

Use high temperature, extreme pressure (EP2) performance grease with 1% max molybdenum disulphide (NLGI Grade 2) lithium base unless otherwise specified.
Every 25 Hours

Figure 4.7: Grease Location (Every 25 Hours)

A - Conditioner Drive Idler
B - Bearing for Finger-Type Conditioner
Figure 4.8: Grease Location (Every 25 Hours)

A - Hitch Steering Pivot
B - Tractor Hitch Pivot
NOTE:
It may be necessary to remove and replace the driveline shield cones during the greasing procedure. Refer to 4.5.2 Driveline Shield Cone, page 204 for more information.

NOTE:
Use high temperature extreme pressure (EP2) performance with 10% max molybdenum disulphide (NLGI Grade 2) lithium base unless otherwise specified.

IMPORTANT:
Apply grease to driveline slip-joint grease fittings.

Figure 4.9: Driveline Grease Location (Every 25 Hours)
A - Primary Driveline Slip-Joint  B - Driveline Slip-Joint
NOTE:
Use high temperature extreme pressure (EP2) performance with 1% max molybdenum disulphide (NLGI Grade 2) lithium base unless otherwise specified.
Every 50 Hours

NOTE:
Use high temperature extreme pressure (EP2) performance with 1% max molybdenum disulphide (NLGI grade 2) lithium base unless otherwise specified.

Figure 4.12: Grease Location (Every 50 Hours)
Every 100 Hours

NOTE:
Ensure top of hitch and disc mower are horizontal, remove check plug from swivel gearbox, and verify that oil slightly runs out when removed.

D - Check Plug - Swivel Gearbox
MAINTENANCE AND SERVICING

Figure 4.14: Lubrication Location (Every 100 Hours)

A - Check Plug - Cutterbar-Conditioner Drive Gearbox (T-Gearbox)

B - Bearing - Field Wheel (2 Places)

C - Bearing - Road Friendly Transport™ Option (2 Places)

12. Remove check plug from conditioner drive gearbox as shown and check oil level.
13. Use high temperature extreme pressure (EP2) performance with 1% max molybdenum disulphide (NLGI grade 2) lithium base.
Every 250 Hours

1. Change lubricant in locations (A), (B), and (C). Refer to the following sections for more information:
   - 4.4.3 Lubricating Cutterbar, page 133.
   - Checking and Changing Conditioner Roll Timing Gearbox Oil, page 239.

Figure 4.15: Lubrication Location (Every 250 Hours)
2. Change lubricant in hitch swivel gearboxes (A), (B), (C), and (D). Refer to 4.5.13 Header Swivel Gearbox and Hitch Swivel Gearbox, page 246.

Figure 4.16: Lubrication Location (Every 250 Hours)

---

**4.4 Servicing Cutterbar**

Check and change the lubricant at regular intervals. Refer to 4.3.1 Maintenance Schedule/Record, page 112.

**IMPORTANT:**
Warm cold lubricant by idling the machine for 10 minutes prior to checking level.

---

**4.4.1 Cutterbar Doors**

Two doors with rubber curtains provide access to the cutterbar area, and reduce the risk of objects being ejected.
Always keep doors closed during operation.

**Inspecting Cutterbar Doors**

1. Ensure that door operates smoothly and lies flat when closed. Adjust if necessary.
2. Inspect hinge pin bolts (A) and tighten to 68.5 Nm (50.5 lbf·ft) if loose.
3. Check door for cracks, and repair if required.
4. Check for exposed metal surfaces and surface rust. Repair and repaint if necessary.
5. Check shield/curtain bolts (B) and replace if missing, or tighten if loose.

![Figure 4.18: R113 Pull-Type Disc Mower](image)

**4.4.2 Replacing Curtains**

Rubber curtains are installed at the following locations:
- Inboard curtain (A) attached to the center fixed cover.
- Door curtains (B) attached to each cutterbar door.
- Outboard curtains (C) attached to each front corner.
- Top cover (not shown) on finger conditioner only.

The curtains form a barrier that minimizes the risk of thrown objects being ejected from the cutterbar area. Always keep curtains down during operation.

Replace the curtains if they become worn or damaged.

![Figure 4.19: Cutterbar Curtains](image)

**Inspecting Curtains**

The cutterbar curtains are important safety features that reduce the potential for thrown objects. Always keep these curtains down when operating the disc mower.

⚠️ **WARNING**

Do **NOT** operate the machine without all the cutterbar doors down or without curtains installed and in good condition.

⚠️ **CAUTION**

To avoid injury, keep hands and fingers away from corners of doors when closing.
Check cutterbar curtains (A) for the following conditions:

- Rips and tears: Replace curtain.
- Cracking: While the curtain may look whole, this is an indicator that failure is imminent—replace curtain.
- Missing bolts: Replace missing hardware before operating.

Removing Cutterbar Door Curtains

The procedure for removing cutterbar door curtains is the same for both doors.

1. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

2. Remove seven nuts (A) from the bolt studs.
3. Remove aluminum liner (B).
4. Remove curtain (C).
Installing Cutterbar Door Curtains

The procedure for installing cutterbar door curtains is the same for both doors.

1. Insert the seven cutterbar door stud bolts (B) into the precut holes on curtain (A).
2. Install seven large washers (C).
3. Install liner panel (D) against washers.
4. Install seven nuts (E) onto bolt studs and torque to 28 Nm (21 lbf·ft).

**IMPORTANT:**
To avoid damaging bolt studs, do **NOT** overtighten the nuts.

5. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

Removing Cutterbar Inboard Curtain

1. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.
2. Remove two M10 carriage head bolts (A) and nuts securing curtain assembly (B) to the disc mower, and remove curtain assembly.
3. Remove four nuts (A) from weld and bolt studs on center shield, remove two curtain brackets (B), and remove curtain.

**Installing Cutterbar Inboard Curtain**

1. Open cutterbar doors. Refer to **3.3.1 Opening Cutterbar Doors, page 36**.

2. Install curtain onto weld and bolt studs on center shield, install two curtain brackets (B), and secure with four nuts (A).

3. Torque to 28 Nm (21 lbf-ft).

**IMPORTANT:**
To avoid damaging bolt studs, do **NOT** overtighten the nuts.
MAINTENANCE AND SERVICING

4. Secure two curtain brackets (A) to center shield using two M10 carriage head bolts (B) and nuts.

5. Torque bolts (A) to 39 Nm (29 lbf·ft).

Removing Outboard Curtains

The procedure for removing outboard curtains is the same for both sides.

1. Open cutterbar door. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

2. Remove four bolts (A), nuts, and large washers securing outboard curtain to endsheet.
3. Remove two nuts (D) from bolt studs.
4. Remove nut (C) from carriage head bolt, slide out the bracket (B), and remove curtain (A).

**Installing Outboard Curtains**

The procedure for installing outboard curtains is the same for both sides.

1. Open cutterbar door. Refer to 3.3.1 Opening Cutterbar Doors, page 36.
2. Install curtain (A) into bracket (B).

3. Install two nuts (D) and tighten.

4. Slide bracket (B) into position, and install the square neck carriage head bolt and flange nut (C).

5. Torque flange nut (C) to 39 Nm (29 lbf-ft).

6. Install four bolts (A), nuts, and large washers to secure outboard curtain to endsheet. Torque bolts to 39 Nm (29 lbf-ft).

4.4.3 Lubricating Cutterbar

Checking and Adding Cutterbar Lubricant

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

⚠️ CAUTION

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.
1. Park the machine on level ground.

2. Lower the header onto 25 cm (10 in.) blocks under both ends of the cutterbar.

3. Shut down the engine, and remove the key.

4. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

5. Use a spirit (bubble) level (A) to ensure the cutterbar is level in both directions. Adjust the disc mower accordingly.

6. Clean area around plug (A). Place a 5 liter (5.2 US qts) capacity container under plug (A).

7. Use a 17 mm socket to remove plug (A) and O-ring (B) from cutterbar. Oil level must be up to the inspection plug hole.

   **NOTE:**
   If additional lubricant is required, refer to Step 8. If additional lubricant is **NOT** required, proceed to Step 16, page 135.

   **IMPORTANT:**
   Do **NOT** overfill the cutterbar. Overfilling can cause overheating, damage, or failure of cutterbar components.

   Add lubricant as follows:

   **NOTE:**
   Refer to for lubricant type.

8. Install the inspection plug that was removed in Step 6, page 134.

   **CAUTION**
   *Never start or move the machine until you are sure all bystanders have cleared the area.*

9. Start the engine, and raise the header fully.

10. Shut down the engine, and remove the key.

11. Close the lift cylinder lock-out valves on both sides of the mower. Valve handles should be in the closed position (90 degree angle to the hose). Refer to 3.1.1 Engaging Locks, page 31.

12. Remove the inspection plug, and add some oil. Loosely install the inspection plug.
13. Open the lift cylinder lock-out valves on both sides of the mower. Valve handles should be in the open position (parallel to the hose). Refer to 3.1.2 Disengaging Locks, page 32.

14. Lower the header on to the blocks. Repeat Step 5, page 134.

15. Repeat Step 6, page 134.

16. Check O-ring (B) for breaks or cracks, and replace if necessary.

17. Install plug (A) and O-ring (B). Tighten securely.

18. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

### Draining Cutterbar

**DANGER**

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator's seat for any reason.

**CAUTION**

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.
1. Start the engine and raise the disc mower.

2. Remove the right hand rock guard. This will improve access to the drain plug (A) located in the end cap of the cutterbar. To remove rock guard, refer to Removing Rock Guards, page 168. To install rock guard, refer to Installing Rock Guards, page 168.

3. Place a block under each end of the disc mower so the right end is lower than the left end.

**IMPORTANT:**
Always drain lubricant from the right end of the disc mower. Draining lubricant from the left end of the disc mower may lead to breather contamination or failure.

4. Lower the disc mower onto the blocks.

5. Shut down the engine and remove the key.

6. Place a 10 liter (10.5 US qts) capacity container under lower end of cutterbar, clean area around plug (A), and remove plug.

**IMPORTANT:**
Do NOT remove hex head bolts (B) securing cutterbar end plate to cutterbar or lubricant leaks could result.

7. Allow sufficient time for lubricant to drain. Loosely install cutterbar plug (A).

**NOTE:**
Do NOT flush the cutterbar.

8. Fill the cutterbar with lubricant before operating the disc mower. Refer to Filling Cutterbar, page 137.

**IMPORTANT:**
Dispose of used lubricant responsibly.
Filling Cutterbar

DANGER

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

CAUTION

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

IMPORTANT:

The cutterbar should be completely empty of oil before filling it. If not, refer to Draining Cutterbar, page 135. If the cutterbar has oil in it and requires more oil, refer to Checking and Adding Cutterbar Lubricant, page 133.

1. Remove access plug (A) from raised end of cutterbar and add the EXACT amount of lubricant specified. Refer to inside back cover of this manual for list of recommended fluids and lubricants.

   IMPORTANT:

   Do NOT overfill the cutterbar. Overfilling can cause overheating, damage, or failure of cutterbar components.

   IMPORTANT:

   Do NOT remove the hex head bolts (B) securing cutterbar end plate to cutterbar or lubricant leaks could result.

2. Install access plug (A). Torque to 30 Nm (22 lbf-ft).

3. Install the right rock guard that was removed. Apply high-strength threadlocker (Loctite® 262 or equivalent) to the threads of the two M16 bolts. Torque to 251 Nm (185 ft lbs).

   CAUTION

   Never start or move the machine until you are sure all bystanders have cleared the area.

4. Start the engine, and raise the disc mower.

5. Stop the engine, remove the key, and engage the disc mower lift cylinder lock-out valves. Refer to 3.1.1 Engaging Locks, page 31.

6. Remove the block from under the cutterbar.

7. Check lubricant level. Refer to Checking and Adding Cutterbar Lubricant, page 133.

4.4.4 Replacing Cutterbar Discs

Perform daily inspections to ensure that cutterbar discs have not suffered damage from rocks, or experienced excessive wear from abrasive working conditions.

Cutterbar discs are interchangeable and can be moved to a spindle that rotates in the opposite direction as long as it is in usable condition and the blades are oriented to cut in the correct direction.
The cutterbar discs are **NOT** repairable and must be replaced if severely damaged or worn.

**IMPORTANT:**
If holes appear in a cutterbar disc, replace the disc immediately. Do **NOT** attempt to repair the cutterbar discs. Always use factory replacement parts.
**Inspecting Cutterbar Discs**

**DANGER**
To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

**CAUTION**
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

**CAUTION**
Damaged blades may damage the cutterbar and result in poor cutting performance. Replace damaged blades immediately.

1. Inspect the cutterbar disc surface (D) for cracks, excessive wear, and disc distortion. Replace as required.
2. Inspect the cutterbar disc edges (E) for cracks, excessive wear, and edge distortion. Replace as required.

**NOTE:**
Cutterbar discs are **NOT** repairable and must be replaced if damaged.

3. Ensure that the disc blade fasteners (A) are securely attached to the cutterbar disc and that nut shields (B) are present and undamaged. Replace as required.
4. Check that the cutterbar disc bolts (C) are securely attached to the spindles. Tighten as required.

**Removing Cutterbar Discs**

**DANGER**
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

**CAUTION**
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Raise disc mower fully, shut off engine, and remove key.
2. Engage lift cylinder lock-out valves. Refer to **3.1.1 Engaging Locks, page 31**.
MAINTENANCE AND SERVICING

3. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

4. Place a pin (or equivalent) in the front hole of the rock guard (B) to prevent disc rotation while loosening bolts.

5. Remove four M12 bolts (A) and washers.

6. Remove cutterbar disc cap (A).

7. Remove cutterbar disc (B).

Installing Cutterbar Discs

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.
MAINTENANCE AND SERVICING

CAUTION
Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Install spacer plate (A) on spindle.

2. Place a pin (or equivalent) in the front hole of the rock guard (D) to prevent disc rotation while tightening bolts.

3. Position new disc (A) on spindle ensuring that it is positioned at a 90 degree angle in relation to the adjacent discs.

4. Install cutter disc cap (B), and secure assembly with four M12 bolts and washers (C). Torque bolts to 85 Nm (63 lbf-ft).

WARNING
Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

5. Remove pin (or equivalent) from front hole of rock guard.

6. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.
4.4.5 Replacing Cutterbar Spindles

To prevent damage to the cutterbar and drive systems, each disc is attached to a spindle containing a shear pin (A).

If the disc contacts a large object such as a stone or stump, the pin will shear and the disc will stop rotating and move upwards while remaining attached to the spindle with a snap ring (B).

**NOTE:**
Once spindle has risen due to shear pin failure, the spindle’s bearing will become unloaded. Do **NOT** replace the spindle due to excessive play. Check play after torquing spindle nut and replacing damaged shear pins.

Refer to *4.4.13 Replacing Cutterbar Spindle Shear Pin, page 193* to replace shear pin.

**IMPORTANT:**
- Spindles that rotate clockwise have right-leading threading and a smooth top on the spindle gear shaft (A).
- Spindles that rotate counterclockwise have left-leading threading and machined grooves on the spindle gear shaft (B) and nut (C).
- If spindle position in cutterbar has changed, the rotational direction of that spindle **MUST** remain the same (that is, a clockwise spindle must maintain its clockwise rotation).
- Failure to maintain rotation pattern can result in damage to spindle and/or cutterbar components.
Removing Cutterbar Spindles

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

**CAUTION**

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Park on a flat, level surface.
2. Lower disc mower fully, shut off engine, and remove key.

**NOTE:**

To prevent oil from spilling from the cutterbar when removing disc spindles, ensure disc mower is on a flat, level surface and is tilted all the way back.

3. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

4. Place a pin (or equivalent) in the front hole of the rock guard (B) to prevent disc rotation while loosening bolts.
5. Remove four M12 bolts (A) and washers.
6. Remove cutterbar disc cap (A).

7. Remove cutterbar disc (B).

**IMPORTANT:**
Blades are rotation specific. Switch entire disc when swapping spindles.

8. Remove spacer plate (A).

9. Rotate spindle hub (A) to access nuts, and remove eleven M12 lock nuts (B) and washers.
10. Remove spindle (A) from cutterbar.
Installing Cutterbar Spindles

Figure 4.57: Underside of Cutterbar Spindles

IMPORTANT:
Right discs (A) and left discs (B) are timed and must be at a 90 degree angle from adjacent discs when reinstalled. Misaligned discs could result in the following:

- Disclades of co-rotating discs hitting each other
- Disclades of diverging discs hitting adjacent discs

Check clearance before tightening spindle to the cutterbar. Turn disc by hand to ensure disclades do not contact each other or adjacent discs. If contact occurs or alignment is incorrect, lift spindle to clear mounting bolts, rotate spindle 180 degrees (ensuring that base does not turn), and reinstall. Recheck timing before bolting hub down and tightening all of the nuts.

NOTE:
Right discs (A) and left discs (B) are slightly offset as shown, depending on which idler gear the spindle is turning.

- Spindles that rotate clockwise have left-leading threading
- Spindles that rotate counterclockwise have right-leading threading

⚠️ DANGER
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ CAUTION
Disclades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.
1. Park on a flat, level surface.

2. Lower the disc mower fully, shut off engine, and remove key.

   **NOTE:**
   To prevent oil from spilling from the cutterbar while installing disc spindles, ensure the disc mower is on a flat, level surface and is tilted all the way back.

3. Open cutterbar doors. Refer to **3.3.1 Opening Cutterbar Doors, page 36.**

4. Determine suitable spindle rotation pattern for crop conditions. Refer to **4.4.5 Replacing Cutterbar Spindles, page 142.**

5. Ensure that spindle O-ring (A) is properly seated, cleaned, and undamaged.
6. Insert spindle (A) into cutterbar.

7. Insert studs (A) into spindle as shown.
   
   **NOTE:**
   Plugs are factory-installed as shown in position (B), but may come loose over time. Ensure studs are inserted into proper location.

   **IMPORTANT:**
   Ensure clockwise spindles rotate clockwise and counterclockwise spindles (with machined grooves) rotate counterclockwise.

   **IMPORTANT:**
   The offset gear design makes it possible to install spindles that rotate in the wrong direction. This will prevent discs from spinning up after impact, resulting in cutterbar component damage.

8. Rotate spindle hub (A) to access studs, and install eleven M12 lock nuts (B) and washers.
9. Torque bolts to 50 Nm (37 lbf-ft) following the tightening pattern shown at right.

**NOTE:**
Hub removed from illustration for clarity.

10. Install spacer plate (A).

11. Place a pin (or equivalent) in the front hole of the rock guard (D) to prevent disc rotation while tightening bolts.

**IMPORTANT:**
Blades are rotation specific. It is necessary to switch entire disc when swapping spindles.

12. Position disc (A) on spindle ensuring that it is positioned at a 90 degree angle in relation to the adjacent discs.

**NOTE:**
Turn disc (A) by hand to ensure disc blades do not contact each other or adjacent discs.

13. Install cutter disc cap (B) and secure assembly with four M12 bolts and washers (C). Torque bolts to 85 Nm (63 lbf-ft).

⚠️ **WARNING**
Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.
14. Remove pin (or equivalent) from front hole of rock guard.

15. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

### 4.4.6 Reconfiguring Cutterbar Crop Stream

Discs are factory-installed to produce three crop streams, but disc rotation pattern can be changed by substitution of spindle and corresponding disc to suit crop conditions. Each spindle and disc pair is designed to rotate in one direction and must be changed as sets when altering crop flows.

Reducing or increasing the number of crop streams will produce the following results:

- Reducing the number of crop streams will result in narrower windrows.
- Increasing the number of crop streams will result in smoother, wider windrows.

**NOTE:** Increasing the number of crop streams will also increase the number of diverging disc pairs which may negatively affect cut quality in certain conditions.

### IMPORTANT:

- Spindles that rotate clockwise have right-leading threading and a smooth top on the spindle gear shaft (A).
- Spindles that rotate counterclockwise have left-leading threading and machined grooves on the spindle gear shaft (B) and nut (C).
- If spindle position in cutterbar has changed, the rotational direction of that spindle **MUST** remain the same (that is, a clockwise spindle must maintain its clockwise rotation).
- Failure to maintain rotation pattern can result in damage to spindle and/or cutterbar components.
Changing R113 Cutterbar Crop Stream Configuration

Figure 4.70: R113 (8 Disc) Spindle Rotation Pattern and Crop Streams

NOTE:
Refer to Removing Cutterbar Spindles, page 143 and Installing Cutterbar Spindles, page 146.

To change R113 (8 disc) spindle rotation from three crop streams (B) to one crop stream (A):
• Swap disc/spindle (3) with disc/spindle (6)

To change R113 (8 disc) spindle rotation from one crop stream (A) to three crop streams (B):
• Swap disc/spindle (6) with disc/spindle (3)

Changing R116 Cutterbar Crop Stream Configuration

Figure 4.71: R116 (10 Disc) Spindle Rotation Pattern and Crop Streams
Figure 4.71  R116 (10 Disc) Spindle Rotation Pattern and Crop Streams (continued)

NOTE:
Refer to Removing Cutterbar Spindles, page 143 and Installing Cutterbar Spindles, page 146.

To change R116 (10 disc) spindle rotation from one crop stream (A) to three crop streams (B):
• Swap disc/spindle (7) with disc/spindle (4).

To change R116 (10 disc) spindle rotation from three crop streams (B) to one crop stream (A):
• Swap disc/spindle (4) with disc/spindle (7).

4.4.7 Maintaining Discblades
Each disc has two blades (A) attached at opposite ends that are free to rotate horizontally on a specially designed shoulder bolt.

The blade (A) has two cutting edges and can be flipped over so that the blade does not need replacing as often.

The blades are NOT repairable and must be replaced if severely worn or damaged.

IMPORTANT:
Always use factory replacement parts.

NOTE:
Discs are equipped with 18-degree bevel-down blades; 11-degree bevel-down blades are offered as a non-standard option. Refer to the R113/R116 Pull-Type Disc Mower Parts Catalog.
Inspecting Discblades

**DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

**CAUTION**

Discblades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

**CAUTION**

Damaged blades may damage the cutterbar and result in poor cutting performance. Replace damaged blades immediately.

**CAUTION**

Damaged or loose discblades or blade attachment hardware can be ejected during machine operation and may cause personal injury or machine damage.

1. Check daily that the discblades are securely attached to the disc.
2. Inspect blades for cracks, blade wear (A), or/and elongated hole (B) beyond safe operating limits (C).
3. Replace blades immediately when problems are noticed.

**IMPORTANT:**

Blades should be replaced in pairs, or the disc may become unbalanced and cause damage to the cutterbar.

**IMPORTANT:**

The discblades have cutting edges on both sides so the blades can be turned over and reused. The twist in each blade determines the cutting direction. If you are unsure which direction the spindles rotate, refer to 4.4.6 Reconfiguring Cutterbar Crop Stream, page 150.

---

**Figure 4.73: Discblades**

A - Blade Wear to Center Line
B - Elongated Hole
C - Maximum Elongation 21 mm (13/16 in.)

**Figure 4.74: Counterclockwise Disc Rotation Direction**
Inspecting Discblade Hardware

⚠️ CAUTION

Damaged or loose discblades or blade attachment hardware can be ejected during machine operation and may cause personal injury or machine damage.

Inspect blade attachment hardware each time blades are changed. Refer to Removing Discblades, page 156 and Installing Discblades, page 157 for hardware replacement procedure.
1. Check and replace bolt if
   - Bolt has been removed and installed five times
   - Head (A) is worn flush with bearing surface of blade
   - Diameter of bolt neck is worn (B) 3 mm (1/8 in.)
   - Bolt is cracked (C)
   - Bolt is visibly distorted (D)
   - Bolt shows evidence of interference (E) with adjacent parts

Figure 4.76: Discblade Bolts
2. Check and replace nuts under the following conditions:
   - Nut has been previously installed—nuts are one-time use only
   - Nut shows signs of wear (A) that is more than half the original height (B)
   - Nut is cracked

Removing Discblades

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ CAUTION

Discblades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Raise disc mower fully, shut off engine, and remove key.
3. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.
4. Rotate disc (A) so that blade (B) faces forward and lines up with hole (C) in rock guard.

5. Place a pin (or equivalent) in the front hole of the rock guard to prevent disc rotation while loosening blade bolts.

6. Clean debris from blade attachment area.

7. Remove nut (A) and discard.

   **IMPORTANT:**
   Nuts are one-time-use only. When flipping or changing a blade, replace using a **NEW** nut only.

8. Remove shoulder bolt (B) and blade (C).

---

**Installing Discblades**

⚠️ **CAUTION**

Discblades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

**IMPORTANT:**

If you are unsure which direction the spindles rotate, refer to *4.4.6 Reconfiguring Cutterbar Crop Stream, page 150.*
1. Place a pin (or equivalent) in the front hole of the rock guard to prevent disc rotation while tightening blade bolts.

2. Install new or reversed blade (A) with shoulder bolt (B) onto disc (C).

   **IMPORTANT:**
   Nuts are one-time-use only. When flipping or changing a blade, replace using a **NEW** nut only.

3. Install new nut (D) and torque to 125 Nm (92 lbf·ft).

   **WARNING**
   Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

4. Close cutterbar doors. Refer to **3.3.3 Closing Cutterbar Doors, page 38.**
4.4.8 Maintaining Quick Change Blade System

The following topics outline maintenance procedures for the optional Quick Change Blade (QCB) system.

Inspecting Retaining Bolts

The material thickness of the retaining bolts and the quick change plate is checked using the supplied gauge.

DANGER

To avoid serious injuries or death due to insufficient thickness of material on the retaining bolts, check the thickness (A) of the retaining bolts every time a blade is changed. Damaged or worn retaining bolts must always be replaced in pairs at each cutting disc.

- Material thickness of the retaining bolts (A) must NOT be less than 14 mm (C) at the weakest point.
- Material thickness at the quick change plate must NOT be less than 3 mm (D) at the weakest point.

1. Gauge (A) is located on the change tool (B).

NOTE:

Section (C) of the gauge is used to check the material thickness of the retaining bolts; section (D) of the gauge is used to check the outer radius of the quick change plate.
2. Thoroughly clean the area around and between the retaining bolts and the quick change plate.

3. Remove blade.

4. Place gauge (A) over the retaining bolt and rotate 90 degrees.

   **NOTE:**
   - If it is **NOT** possible to slide the gauge over the retaining bolt during the rotation, then the retaining bolt is still in working order.
   - If it is possible to slide the gauge over the retaining bolt during rotation, then the retaining bolt must be replaced immediately.

---

**Inspecting Quick Change Plates**

The material thickness of the retaining bolts and the quick change plate is checked using the supplied gauge.

**DANGER**

To avoid serious injury or death due to worn quick change plate, check the plates for damage before and after each use. The wear limit of the quick change plate is reached when the application seam is worn away at one point. The wear limit must be checked with gauge (A).

1. Gauge (A) is located on the change tool (B).

   **NOTE:**
   Section (C) of the gauge is used to check the material thickness of the retaining bolts; section (D) of the gauge is used to check the outer radius of the quick change plate.
2. Thoroughly clean the area around and between the retaining bolt and the quick change plate.

3. Place the gauge (A) against the retaining bolt of the quick change plate (B) as far as it will go.

**NOTE:**
- If the outer radius of the quick change plate (B) aligns with or is outside the outer radius of the gauge (A), the quick change plate has not yet reached its wear limit.
- If the outer radius of the quick change plate (B) does **NOT** align with the outer radius of the gauge (A), the quick change plate must be replaced.
Replacing Quick Change Blades

If optional quick change blade kit is installed, replace blades as follows:

1. Remove any material that has collected between the quick change plate and the rock guard.
2. Remove change tool (A) from storage position.
3. Place the blade change tool (A) between the disc (B) and quick change plate (C).
4. Pull down on tool (A) and remove old blade (D) on blade bolt (E). Return tool (A) upward to closed position.
5. Pull down on tool (A) and insert new blade (D) on blade bolt (E).
6. Return tool (A) upwards trapping blade in disc assembly.

IMPORTANT:
Check that blade change tool (A) is fully engaged on both sides of the disc (B).
4.4.9 Replacing Accelerators

Accelerators (A) are mounted on each outboard disc and are designed to quickly move cut material off the disc and into the conditioner.

One pair of accelerators is installed at each outboard end of a 4.0 m (13 ft.) disc mower, whereas a 4.9 m (16 ft.) disc mower has two pairs at each end.

Periodically inspect accelerators for damage and loose or missing fasteners, and replace as necessary.

**IMPORTANT:**
Always replace accelerators in pairs to ensure proper disc balance.

**Inspecting Accelerators**

**DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Raise disc mower fully, stop engine, and remove key.
2. Engage lift cylinder lock-out valves. Refer to **3.1.1 Engaging Locks, page 31**.
3. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

⚠️ CAUTION
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

4. Inspect accelerators for damage and wear, and replace if worn to 50% or more of their original height or if they are no longer effectively moving crop.

5. Check for loose or missing fasteners; tighten or replace as necessary.

Figure 4.93: R113 Pull-Type Disc Mower
Removing Accelerators

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

**IMPORTANT:**
Always replace accelerators in pairs to ensure proper disc balance.

1. Raise disc mower fully, shut off engine, and remove key.

2. Engage lift cylinder lock-out valves. Refer to [3.1.1 Engaging Locks, page 31](#).

**CAUTION**

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

3. Remove nut (A), flange bolt (B), and discblade (C) from disc. Discard nut.

4. Remove lock nut (A), accelerator (B), blade holder (C), and hex-socket bolt (D).

5. Repeat the removal procedure for the second accelerator.
Installing Accelerators

⚠️ DANGER
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ CAUTION
Discblades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

IMPORTANT:
Always replace accelerators in pairs to ensure proper disc balance.

1. Place a wooden block between two cutterbar discs to prevent disc rotation while tightening blade bolts.

   IMPORTANT:
   Accelerators can operate in a clockwise or counterclockwise direction. Verify the direction of the disc before installing accelerators. If you are unsure which direction the spindle rotates, refer to 4.4.5 Replacing Cutterbar Spindles, page 142.

2. Install lock nut (A), accelerator (B), blade holder (C), and hex-socket bolt (D). Do NOT tighten at this time.

3. Install new nut (A), flange bolt (B), and discblade (C) onto disc.

![Figure 4.96: Accelerator Install](image1)

![Figure 4.97: Accelerator Install](image2)
4. Torque the inside nut (A) to 58 Nm (43 lbf·ft).
5. Torque the outside nut (B) (closest to the blade) to 125 Nm (92 lbf·ft).
6. Repeat the installation procedure for the second accelerator.

⚠️ WARNING
Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

7. Remove wooden block.
8. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

4.4.10 Replacing Rock Guards
The machine is equipped with rock guards at each cutting disc location. Rock guards prevent the cutterbar from digging into the ground and protect the disc from coming in contact with stones and other debris.

Inspecting Rock Guards

⚠️ DANGER
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ CAUTION
Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Raise disc mower fully, stop engine, and remove key.
3. Inspect rock guards for wear, cracks, damage, or distortion. Replace if worn to 75% or more of their original thickness.
4. Check for loose or missing fasteners; tighten or replace fasteners as needed.
Removing Rock Guards

1. Remove two hex head screws, washers, and lock nuts (A).

2. Slide rock guard (A) forward in the direction of arrow (B) and remove.

Installing Rock Guards

1. Guide rock guard onto cutterbar until tabs (A) sit on top of the cutterbar while bottom back bolt holes line up.
2. Install two hex head screws, washers, and lock nuts (A). Torque to 68 Nm (50 lbf·ft).

**NOTE:**
Lock nuts (A) are installed on top.

---

### 4.4.11 Replacing Small Drums

Drums deliver cut material from the ends of the cutterbar and help maintain an even crop flow into the conditioner. Drums are attached to the outboard discs at each end of the cutterbar on a 4.0 m (13 ft.) disc mower, and to the two outboard discs on a 4.9 m (16 ft.) disc mower.

**IMPORTANT:**
The inboard drums (A) are approximately 73 mm (2-3/8 in.) smaller in diameter than the outboard drums (A).

**IMPORTANT:**
Measure drum size to determine if small or large drums are installed on your disc mower. Large drums measure 250 mm (9-7/8 in.) across. Small drums measure 187 mm (7-3/8 in.) across. If your disc mower has large drums, refer to 4.4.12 Replacing Large Outboard Drums, page 180.

---

**Inspecting Small Drums**

Inspect drums daily for signs of damage or wear.

⚠️ **DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ **CAUTION**

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Lower disc mower fully, shut off engine, and remove key.
2. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

3. Inspect drums (A) and (B) for damage and wear, and replace if drums are worn at the center to 50% or more of their original thickness. Do NOT repair drums.

4. Examine drums for large dents. Replace dented drums to prevent an imbalance in the cutterbar.

5. Tighten or replace loose or missing fasteners.

**WARNING**

Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

6. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

---

**Removing Small Driven Drums and Driveline**

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.
CAUTION

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

NOTE:

Illustrations show left side drum and driveline—right side drum and driveline are similar.

1. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

2. Remove four M10 hex flange head bolts (A) and remove vertical driveshield (B).

3. Remove two M10 hex flange head bolts (A) and remove cover plate (B).
4. Remove four M10 hex flange head bolts (A), and remove top plate (B) and drum top (C).

5. Remove one 20 mm M10 hex flange head bolt (B), two 16 mm M10 hex flange head bolts (C), and vertical shield (A).

6. Remove eight M8 hex flange head bolts (A), and remove two drum shields (B).
7. Remove four M12 hex flange head bolts (A) and spacers securing driveline assembly (B) to hub drive (C).

8. Slide driveline (A) downwards, tilt to the side, and pull driveline up and out of drum.

NOTE:
For clarity, illustration shows cutaway view of drum and tube shield.

9. Use a 18 mm deep socket to remove the four M12 bolts (A) and washers holding the drum disc in place.

10. Remove drum disc assembly.

Installing Small Driven Drums and Driveline

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.
Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

NOTE:
Illustrations show left side drum and driveline—right side drum and driveline are similar.

1. Position the drum disc assembly as shown.
2. Use a 18 mm deep socket to install the four M12 bolts (A) and washers that hold the drum disc in place. Torque to 85 Nm (63 lbf·ft).

3. Lubricate spindle splines (A). For specifications, refer to the inside back cover of this manual.

NOTE:
For clarity, illustration shows cutaway view of drum and tube shield.

4. Insert driveline (B) at an angle and guide it past hub drive (C) and drum (D).

5. Insert splined spindle end (A) into splined bore of driveline (B).

6. Place a bead of medium-strength threadlocker (Loctite® 242 or equivalent) around threads, and install four M12 hex flange head bolts (A) and spacers to secure driveline assembly (B) to hub drive (C). Torque bolts to 95 Nm (70 lbf·ft).
7. Position two drum shields (B) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and use eight M8 hex flange head bolts (A) to secure drum shields in place. Torque to 29 Nm (21 lbf·ft).

8. Position vertical shield (A) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then use one M10 hex flange head bolt (B) and two M10 hex flange head bolts (C) to secure vertical shield in place. Torque to 57.5 Nm (42 lbf·ft).

9. Position top plate (B) and drum top (C) onto drum as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then use four M10 hex flange head bolts (A) to secure the top plate and drum top in place.
10. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then install top M10 hex flange head bolt (B) through cover plate (A) and top plate (C).

11. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then install lower M10 hex flange head bolt (D) through cover plate (A) and vertical shield (E).

12. Tighten bolts (B) and (D).

13. Position vertical driveshield (B) as shown at right. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then use four M10 hex flange head bolts (A) to secure vertical driveshield in place.

**WARNING**

Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.
14. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

Removing Small Non-Driven Drums

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ CAUTION

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.
2. Remove the four M12 bolts (A) outside the drum using a 18 mm socket.
3. Remove drum/disc (B).

**Installing Small Non-Driven Drums**

⚠️ **DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ **CAUTION**

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Ensure spacer (A) is on spindle.
MAINTENANCE AND SERVICING

2. Position the non-driven drum/disc (B) onto spindle as shown.

3. Use a 18 mm deep socket to install the four M12 bolts (A) and washers securing drum/disc to spindle. Torque to 55 Nm (40 lbf·ft).

![Figure 4.129: Non-Driven Drum](image)

**WARNING**

Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

4. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

![Figure 4.130: R113 Pull-Type Disc Mower](image)
4.4.12 Replacing Large Outboard Drums

Drums deliver cut material from the ends of the cutterbar and help maintain an even crop flow into the conditioner. Drums are attached to the two outboard discs on a 4.9 m (16 ft.) disc mower.

**IMPORTANT:**
The inboard drums (B) are approximately 73 mm (2-3/8 in.) smaller in diameter than the outboard drums (A).

Large drums measure 250 mm (9-7/8 in.) across. Small drums measure 187 mm (7-3/8 in.) across.

![4.9 m (16 ft.) Drums](image1.png)

**Inspecting Large Drums**

Inspect drums daily for signs of damage or wear.

⚠️ **DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ **CAUTION**

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Lower disc mower fully, shut off engine, and remove key.
2. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.
3. Inspect drums (A) and (B) for damage and wear, and replace if drums are worn at the center to 50% or more of their original thickness. Do NOT repair drums.

4. Examine drums for large dents. Replace dented drums to prevent an imbalance in the cutterbar.

5. Tighten or replace loose or missing fasteners.

**WARNING**

Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

6. Close cutterbar doors. For instructions, refer to 3.3.3 Closing Cutterbar Doors, page 38.

---

**Removing Large Driven Drums and Driveline**

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

**CAUTION**

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

**NOTE:**

Illustrations show left side drum and driveline—right side drum and driveline are similar.
1. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

2. Remove four M10 hex flange head bolts (A) and remove vertical driveshield (B).

3. Remove two M10 hex flange head bolts (A) and remove cover plate (B).
4. Remove four M10 hex flange head bolts (A), and remove top plate (B) and drum top (C).

5. Remove one 20 mm M10 hex flange head bolt (A), two 16 mm M10 hex flange head bolts (B), and vertical shield (C).

6. Remove eight M8 hex flange head bolts (A), and remove two drum shields (B).
7. Remove four M12 hex flange head bolts (A) and spacers securing driveline assembly (B) to hub drive (C).

8. Slide driveline (A) downwards, tilt to the side, and pull driveline up and out of drum.

**NOTE:**
For clarity, illustration shows cutaway view of drum and tube shield.
MAINTENANCE AND SERVICING

9. Inside the drum, use a 305 mm (12 in.) extension and 18 mm deep socket to remove the four M12 bolts (A) and washers holding the drum disc in place.

10. Remove drum disc assembly.

---

**Installing Large Driven Drums and Driveline**

⚠️ **DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ **CAUTION**

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

**NOTE:**

Illustrations show left side drum and driveline—right side drum and driveline are similar.
1. Position the drum disc assembly as shown.

   **NOTE:**
   Disc oriented so that blades are at 90 degrees (1/4 turn) to the adjacent disc.

2. Use a 305 mm (12 in.) extension and 16 mm deep socket to install the four M12 bolts (A) and washers that hold the drum disc in place. Torque to 85 Nm (63 lbf-ft).

3. Lubricate spindle splines (A). For specifications, refer to the inside back cover of this manual.

   **NOTE:**
   The driveline U-joints were greased at the factory and considered to be lubricated for life. No further lubrication is required.

   **NOTE:**
   For clarity, illustration shows cutaway view of drum and tube shield.

4. Insert driveline (B) at an angle and guide it past hub drive (C) and drum (D).

5. Insert splined spindle end (A) into splined bore of driveline (B).
6. Place a bead of medium-strength threadlocker (Loctite® 242 or equivalent) around threads, and install four M12 hex flange head bolts (A) and spacers to secure driveline assembly (B) to hub drive (C). Torque bolts to 95 Nm (70 lbf-ft).

7. Position two drum shields (B) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and use eight M8 hex flange head bolts (A) to secure drum shields in place. Torque to 29 Nm (21 lbf-ft).

8. Position vertical shield (A) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then use one M10 hex flange head bolt (B) and two M10 hex flange head bolts (C) to secure vertical shield in place. Torque to 57.5 Nm (42 lbf-ft).
9. Position top plate (B) and drum top (C) onto drum as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then use four M10 hex flange head bolts (A) to secure the top plate and drum top in place.

10. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then install top M10 hex flange head bolt (B) through cover plate (A) and top plate (C).

11. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then install lower M10 hex flange head bolt (D) through cover plate (A) and vertical shield (E).

12. Tighten bolts (B) and (D).
13. Position vertical driveshield (B) as shown at right. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around threads, and then use four M10 hex flange head bolts (A) to secure vertical driveshield in place.

⚠️ WARNING
Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

14. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

Removing Large Non-Driven Drums

⚠️ DANGER
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ CAUTION
Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.
1. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

2. Place a wooden block between two cutterbar discs to prevent disc rotation while loosening blade bolts.

3. Remove eight M8 bolts (A) and washers securing the cover (B) to the non-driven drum, and remove cover.

4. Remove the four M10 bolts (A) inside the drum using a 305 mm (12 in.) extension and 16 mm socket.

5. Remove wooden block.

6. Remove drum/disc (B).
Installing Large Non-Driven Drums

DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

CAUTION

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Ensure spacer (A) is on spindle.

2. Position the non-driven drum/disc (B) onto spindle as shown.

3. Use a 305 mm (12 in.) extension and 16 mm deep socket to install the four M12 bolts (A) and washers securing drum/disc to spindle. Torque to 85 Nm (63 lbf-ft).
4. Install eight M8 bolts (A) and washers to secure cover to non-driven drum, and torque to 28 Nm (20 lbf·ft).

⚠️ **WARNING**

Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

5. Close cutterbar doors. Refer to **3.3.3 Closing Cutterbar Doors, page 38**.
4.4.13 Replacing Cutterbar Spindle Shear Pin

To prevent damage to the cutterbar and drive systems, each disc is attached to a spindle containing a shear pin (A).

If the disc contacts a large object, such as a stone or stump, the pin will shear and the disc will stop rotating and move upwards while remaining attached to the spindle with a snap ring (B).

IMPORTANT:
Ensure correct orientation of the shear pins during replacement.

- Spindles that rotate clockwise have right-leading threading.
- Spindles that rotate counterclockwise have left-leading threading.

NOTE:
Once spindle has risen due to shear pin failure, the spindle’s bearing will become unloaded. Do NOT replace the spindle due to excessive play. Check play after torquing spindle nut and replacing damaged shear pins.

Removing Cutterbar Spindle Shear Pin

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

⚠️ CAUTION
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Raise disc mower fully, shut off engine, and remove key.
3. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

4. Clean debris from work area.

5. Depending on the type of disc with a broken shear pin, refer to the applicable disc removal procedure.
   - To remove cutterbar disc (A). Refer to Removing Cutterbar Discs, page 139.
   - To remove driven drum (B). Refer to Removing Large Driven Drums and Driveline, page 181.
   - To remove non-driven drum (C). Refer to Removing Large Non-Driven Drums, page 189.

6. Remove retaining ring (A).
7. Remove M12 bolt and remove safecut spindle-nut wrench (A) from left side shield plate.

**IMPORTANT:**

- Spindles that rotate clockwise have right-leading threading and a smooth top on the spindle gear shaft (A).
- Spindles that rotate counterclockwise have left-leading threading and machined grooves on the spindle gear shaft (B) and nut (C).
- If spindle position in cutterbar has changed, the rotational direction of that spindle **MUST** remain the same (that is, a clockwise spindle must maintain its clockwise rotation).
- Failure to maintain rotation pattern can result in damage to spindle and/or cutterbar components.

8. Remove two M10 bolts and washers (A).
9. Use the safecut spindle-nut wrench and remove nut (A).

10. Remove shear pins (B). Do **NOT** damage the pin bore on the pinion.

11. Remove the hub (A).

12. Check the nut and hub for damage. Replace if necessary.
Installing Cutterbar Spindle Shear Pin

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

⚠️ CAUTION

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Fill the space above the bearing with grease.
2. Place the hub (A) on the spindle (C).
3. Install shear pins (B).

4. Observe orientation of groove in shear pin (A).

**IMPORTANT:**
The correct shear pin orientation is critical. Both shear pin grooves (A) must be facing the same direction and parallel to the cutterbar.

**NOTE:**
Shaft removed from illustration for clarity.
5. Install nut (A).

6. Attach the safecut spindle-nut wrench (B) 90 degrees (D) to the torque wrench (A).

   IMPORTANT:
   If this is not done, the proper torque will NOT be applied to the nut.

7. Locate the safecut spindle-nut wrench (B) on spindle nut (C) and torque to 300 Nm (221 lbf·ft).

8. Return safecut spindle-nut wrench to left side shield plate.

9. Inspect the threads of the two M10 bolts (A) and replace if damaged.

10. Install two M10 bolts (A) and washers. Torque to 55 Nm (40 lbf·ft).
11. Install retaining ring (A).

12. Depending on the type of disc with the new shear pin, refer to the applicable disc installation procedure.
   - Install cutterbar disc (A). Refer to Installing Cutterbar Discs, page 140.
   - Install driven drum (B). Refer to Installing Large Driven Drums and Driveline, page 185.
   - Install non-driven drum (C). Refer to Installing Large Non-Driven Drums, page 191.

**WARNING**

Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

13. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.
4.5 Drive Systems

4.5.1 Driveshields

*Removing Driveshields*

⚠️ **CAUTION**

Do NOT operate the machine without the driveshields in place and secured.

**NOTE:**

Images shown in procedure are for left side driveshield (A). Right side driveshield is similar.

1. Remove lynch pin (A) and tool (B) from pin (C).

![Figure 4.178: Left Driveshield](image)

![Figure 4.179: Tool to Unlock Driveshield](image)
2. Insert flat end of tool (A) into latch (B) and turn it counterclockwise to unlock.

3. Pull top of driveshield (A) away from the disc mower and lift off the pins at the base of the shield to remove.
Installing Driveshields

⚠️ CAUTION

Do NOT operate the machine without the driveshields in place and secured.

**NOTE:**
Images shown in procedure are for left side driveshield—right side driveshield is similar.

1. Position driveshield (A) onto pins (B) at base of driveshield.
2. Push driveshield to engage latch (C).
3. Check that driveshield (A) is properly secured.

4. Replace tool (B) and lynch pin (A) on pin (C).
Replacing Driveshield Latch

⚠️ CAUTION
Do NOT operate the machine without the driveshields in place and secured.

NOTE:
Images shown are for left side driveshield—right side driveshield is similar.

2. Remove hex nut (A) and flat washer securing latch to backside of driveshield, replace latch if worn or damaged, and reinstall nut and washer.
3. Remove two carriage bolts (A), replace stud and clip assembly (B) if worn or damaged, and reinstall carriage bolts.

### 4.5.2 Driveline Shield Cone

*Removing Driveline Shield Cone*

**WARNING**

Do NOT operate the machine without the driveline shield cones in place and the lever clamps securely fastened.

1. Release two lever clamps (A) using a screwdriver or similar prying tool.
2. Unhook safety chain (B) from hitch, and ensure that chain is secured to the shield cone and metal plate.

![Figure 4.186: Stud and Clip Assembly](image)

![Figure 4.187: Driveline Shield Cone and Lever Clamp](image)
3. Remove shield cone from metal plate (A) and slide cone along driveshaft.

**Installing Driveline Shield Cone**

**WARNING**

Do NOT operate the machine without the driveline shield cones in place and the lever clamps securely fastened.

1. Slide shield cone along driveshaft until it is seated in metal plate (A).
2. Securely fasten two lever clamps (A) to metal plate (B).

3. Attach safety chain (C) to hitch, and ensure that chain is secured to the shield cone and metal plate.

4.5.3 Hitch Driveline Phasing

To reduce hitch driveline vibration, the drivelines should be installed in a specific orientation. If repairing or replacing, ensure the following orientations are used.

To minimize vibrations, the hitch drivelines on the R113 and R116 must be phased correctly.

- On the R113 disc mower (refer to Figure 4.191, page 206), the U-joint on the clutch driveline (B) must be aligned 90° to the U-joint on front driveline (A).

- On the R116 disc mower (refer to Figure 4.192, page 207), the U-joint on the middle driveline (B) must be aligned 90° to the U-joints on the front driveline (A) and the clutch driveline (C).
4.5.4 Primary Driveline

The primary driveline transfers power from the tractor’s power take-off (PTO) to the disc mower’s hitch swivel gearbox. Follow regular lubrication procedures and ensure all driveline taper pins are torqued as instructed. Refer to 4.4.3 Lubricating Cutterbar, page 133.

Removing Primary Driveline

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Stop engine, and remove key from ignition.
2. Unhook the mower from the tractor. Refer to 3.8 Detaching Disc Mower from Tractor, page 49.
3. Release two lever clamps (A) using a screwdriver or similar prying tool.

**NOTE:**
Only one lever clamp is shown in the illustration at right.

4. Slide driveline shield cone away from gearbox.
5. Loosen nut (A) so that taper pin threads are recessed inside the nut.
6. Tap nut (A) with a hammer to loosen the taper pin and release driveline yoke from the shaft.
7. Pull driveline off gearbox.
8. Remove driveline guard if necessary. Refer to *Removing Driveline Guards, page 230.*

### Installing Primary Driveline

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator's seat for any reason.

1. Stop engine, and remove the key from ignition.
2. Install driveline guard onto driveline (if previously removed). Refer to *Installing Driveline Guards, page 231.*
NOTE:
Before installing the driveline, refer to 4.5.3 Hitch Driveline Phasing, page 206 to ensure proper orientation.

3. Position U-joint (A) and grease fitting (B) as shown.

4. Install taper pin (A) so groove on pin is aligned with groove on shaft.

5. Ensure there is no grease on taper pin threads after installing into yoke.

6. Torque the taper pin nut (A) to 150 Nm (110 lbf·ft). Clutch taper pin must be recessed approximately 0–2 mm (0–5/64 in.) inside the yoke.

IMPORTANT:
Do NOT use an impact tool to install or torque nut.

IMPORTANT:
Check taper pin and torque every 25 hours until it stops moving, then check before start of every season.

NOTE:
For all other joints that use the taper pin, the pin must be recessed approximately 9–11 mm (3/8–7/16 in.).

7. Slide shield cone towards the gearbox, and fasten the two lever clamps (A) to the metal plate.

NOTE:
Only one of the two lever clamps is visible in the illustration at right.
8. Attach the male half (A) of the driveline to the female half, and position onto storage hook (B) or connect to tractor power take-off (PTO). To attach unit to tractor, refer to 3.7 Attaching Disc Mower to the Tractor, page 41.

![Figure 4.199: Primary Driveline](image)

### 4.5.5 Hitch Driveline

The hitch driveline is a solid shaft that connects the hitch swivel gearbox to the clutch driveline. The hitch driveline is supported by a bearing at the approximate midpoint of the hitch. Replace the driveline if there are signs of damage, excessive vibration, or excessive noise.

Other than regular lubrication, no maintenance is required. Refer to 4.4.3 Lubricating Cutterbar, page 133.

![Figure 4.200: Hitch Driveline](image)

#### Removing Hitch Driveline

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.
1. Stop engine, and remove key from ignition.

2. Disconnect clutch driveline (A) at the center support. Do not remove entire driveline. Refer to Removing Clutch Driveline, page 218.

3. Remove two bolts (A), and slide the metal shield (B) away from center support.
MAINTENANCE AND SERVICING

4. Remove mid-drive yoke (A) from hitch driveshaft.

5. Remove two nuts (A) that secure metal plate (B) to the center support, and then remove metal plate (B).

6. Remove spacer (A).
7. Support driveline and remove five nuts (A), flange (B) with grease fitting, ball bearing (C), and second flange (D).

8. Unlock the bearing lock collar (A) by rotating it in the direction opposite to the rotation of the shaft.

9. Slide the bearing lock collar off the driveline shaft.

10. Lower the driveline from the center support.

**NOTE:**
If removing bolts, note position of the long bolts (B) and short bolts (C).

11. Slide the forward end of hitch driveline (A) away from swivel gearbox shaft.

**NOTE:**
There are three hitch drivelines installed on R116 disc mowers.

12. Remove driveline guard if necessary. Refer to *Removing Driveline Guards, page 230.*

---

**Installing Hitch Driveline**

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.
1. Install driveline guard onto driveline (if previously removed). Refer to *Installing Driveline Guards, page 231.*

**NOTE:**
Before installing the driveline, refer to **4.5.3 Hitch Driveline Phasing, page 206** to ensure proper orientation.

2. Orient U-joint (A) and grease fitting (B) as shown.

3. Position forward end of hitch driveline (C) onto hitch swivel gearbox shaft and push onto shaft.

**IMPORTANT:**
If installing a replacement guard, ensure chain (A) is short enough that it does **NOT** wrap around the driveline guard.

5. Slide lock collar (A) on shaft.

6. Position shaft end of the driveline onto the hitch support bracket, and support the driveline to hold it in place.

**IMPORTANT:**
Ensure the locking collar (A) is on the backside of the support bracket.

7. Install two long bolts (B) and three short bolts (C) exactly as shown.
8. Install flange (A).

9. Ensure distance (B) between the tip of the shaft and the front face of the center support is 136 mm to 144 mm (5-3/8 in. to 5-11/16 in.).

10. Install ball bearing (C).

11. Tighten the locking collar in the direction of the shaft rotation.

12. Install flange (B) with grease fitting (D), and five nuts (A).

   **IMPORTANT:**
   Grease fitting (D) must be positioned 90 degrees from long bolts as shown.

13. Install spacer (A) with cutout in spacer aligned with grease fitting (B).
14. Position metal plate (B) on center support.

15. Apply medium-strength threadlocker (Loctite® 243 or equivalent) to two nuts (A), and then use them to secure metal plate (B) while ensuring loop on metal plate (C) is positioned on lower side as shown.

16. Torque nuts (A) to 20 Nm (15 lbf·ft).

17. Position driveshield cover on center support and secure with three screws (A).

18. Install metal shield (C) with two bolts (B).

NOTE:
There are three hitch drivelines for installation on the R116 disc mower.
19. Install clutch driveline (A) at center support. Refer to *Installing Clutch Driveline, page 219.*

### 4.5.6 Clutch Driveline

The clutch driveline (A) transfers power from the hitch driveline to the header swivel gearbox through a clutch mechanism.

Replace the driveline if there are signs of damage, excessive vibration, excessive noise, or if the clutch needs replacing.

Follow regular lubrication procedures and ensure all driveline taper pins are torqued as instructed. Refer to *4.4.3 Lubricating Cutterbar, page 133* and *4.5.8 Inspecting Driveline Taper Pins, page 228.*

Perform run-in procedure as part of the mower’s initial break-in procedure, when clutch friction linings have been replaced, or when the unit has not been operated in 6 months. Refer to *Checking Clutch Operation, page 222.*
Removing Clutch Driveline

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Stop engine, and remove key from ignition.
2. Release two lever clamps (A) using a screwdriver or similar prying tool.
3. Unhook safety chain (B) from hitch, and ensure that chain is secured to the shield cone and metal plate (C).
4. Remove driveline shield cone from metal plate, and slide driveline shield cone (A) away from center support.
5. Loosen nut (B) and use a hammer to release yoke from taper pin lock.

Figure 4.219: Driveline Shield Cone

Figure 4.220: U-Joint
6. Slide clutch driveline (A) off hitch driveline.
7. Separate the driveline (A).

8. Release two lever clamps (A) on the shield cone installed at the header swivel gearbox.

10. Slide shield away from gearbox.
11. Loosen nut (A), use a hammer to release driveline from taper pin lock, and pull driveline off gearbox shaft.

**Installing Clutch Driveline**

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.
1. Stop engine, and remove key from ignition.

2. Install driveline guard onto driveline (if previously removed). Refer to Installing Driveline Guards, page 231.

3. Position driveline onto the gearbox shaft as shown at right.

4. Clean the taper pin threads.

5. Install taper pin into yoke with groove on pin aligned with groove in shaft. Ensure there is no grease on threads after inserting pin through yoke.

6. Secure pin with nut (A). Torque to 150 Nm (110 lbf·ft). Pin should be flush with yoke.

   **IMPORTANT:**
   Check taper pin torque every 25 hours until it stops moving, then check before every season.

7. Slide the shield cone to the gearbox and secure with the two lever clamps (A).

8. For R113 disc mower clutch driveline:
   a. Assemble forward half (A) of clutch driveline onto female half and attach to shaft on hitch driveline (B).
   b. Position the U-joint (C) as shown.
9. **For R116 disc mower clutch driveline:**
   a. Assemble forward half (A) of clutch driveline onto female half and attach to shaft on hitch driveline (B).
   b. Position the U-joint (C) and grease fitting (D) as shown.

   **NOTE:**
   Before installing the driveline, refer to 4.5.3 Hitch Driveline Phasing, page 206 to ensure proper orientation.

10. Move the shield cone to expose the U-joint.

   **NOTE:**
   Shield cone not shown in illustration at right.

11. Clean the taper pin threads.

12. Install taper pin so groove on pin is aligned with groove on shaft. Ensure there is no grease on taper pin threads after installing into yoke.

13. Torque the taper pin nut (A) to 150 Nm (110 lbf·ft). Pin should be recessed 9–11 mm (3/8–7/16 in.) into yoke.

   **IMPORTANT:**
   Check taper pin torque every 25 hours until it stops moving, then check before every season.
14. Slide shield cone onto metal plate (C) attached to center support, secure with two lever clamps (A), and hook safety chain (B) to hitch.

**IMPORTANT:**
If installing a replacement guard, ensure chain (B) is short enough that it does **NOT** wrap around the driveline guard.

---

**Checking Clutch Operation**

The driveline clutch requires an initial break-in procedure otherwise the clutch may slip prematurely. As part of the break-in procedure, the clutch spring pressure should be released and the header engaged. This intentional slippage of the clutch will wear in and seat the friction linings against the metal drive plates and remove any oxidization.

Perform the following run-in procedure during the disc mower’s initial break-in, whenever the clutch friction linings have been replaced, or when the unit has not been operated for 6 months or more.

1. Release two lever clamps (A) on the shield cone installed at the header swivel gearbox.
2. Slide shield away from gearbox.
3. Mark a horizontal line (A) across friction discs and drive plates with a paint marker.

4. Back off all pressure plate tensioning nuts (B) one and a half revolutions.

5. Reattach the shield cone onto the header swivel gearbox.

6. Start tractor and adjust engine speed to 1000 rpm.

7. Engage the tractor’s power take-off (PTO) for 3–5 seconds. Repeat three times.

   **NOTE:**
   The clutch will slip with a force of 1350 Nm (995 lbf·ft) at 1000 rpm.

8. Shut down the engine and remove the key.

9. Inspect the clutch. The horizontal mark (A) across the friction discs should no longer line up with the metal drive plates. This indicates the clutch was slipping.

   **NOTE:**
   It is not necessary for the indicating mark on the friction discs to be misaligned from the metal drive plates on both sides of the disc. The friction discs are not splined to any component and will likely only slip on one surface.

10. Remove the shield cone from the header swivel gearbox.

11. If acceptable slippage is detected, retighten clutch spring adjustment nuts (B). Refer to *Adjusting Clutch, page 224.*

12. If acceptable slippage is not detected, the clutch should be removed and disassembled for inspection/repair. Contact your MacDon Dealer.

13. Slide the shield cone to the gearbox and secure with the two lever clamps (A).
Adjusting Clutch

1. Release two lever clamps (A) on the shield cone installed at the header swivel gearbox.

2. Back off all pressure plate tensioning nuts (A) one and a half revolutions.

**NOTE:**
If this has already been done, you are not required to do it again.

3. Measure the distance (A) between Belleville washer (B) and plate (C) using a caliper. The distance must be 17.75 mm (0.70 in.) and must be consistent all around.
4. Tighten nuts using the sequence shown at right. Once the discs are nearing the 17.75 mm (0.70 in.) dimension, check discs for looseness. Do NOT tighten the discs excessively. Try to achieve a balance between the clutch slipping during excessive loading and/or shock loading and not slipping during normal operation.

5. Test the clutch operation, and adjust evenly as required. Refer to Checking Clutch Operation, page 222.

6. Slide the shield cone to the gearbox and secure with two lever clamps (A).

4.5.7 Cross Driveline

The cross driveline (A) transfers power from the tractor’s power take-off (PTO) to the cutterbar-conditioner drive gearbox (T-gearbox). Follow the regular lubrication schedule for this component. Refer to 4.3.5 Lubricating the Disc Mower, page 116.
Removing Cross Driveline

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Stop engine and remove key from ignition.
2. Open the cutterbar doors to access the cross driveline (A) from inside the disc mower. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

3. Loosen clamp (A) and slide the driveline shield (B) away from the yoke.
4. Repeat for the opposite end of the driveline.

5. Loosen nut (A) so that taper pin threads are recessed inside the nut.
6. Tap nut (A) with a hammer to loosen the taper pin and release driveline yoke (B) from the shaft.
7. Repeat for the opposite end of the driveline.
8. Remove the cross driveline shaft.
Installing Cross Driveline

**DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Stop engine and remove key from ignition.

2. Open the cutterbar doors to install the cross driveline (A) from inside the disc mower. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

3. Position driveline yoke (B) as shown on both ends of the cross driveline.

4. Install taper pin so groove on pin is aligned with groove on shaft.

5. Install nut (A) onto taper pin and torque to 150 Nm (110 lbf·ft). Pin must be recessed 9–11 mm (3/8–7/16 in.) inside the yoke.

   **IMPORTANT:**

   Check taper pin torque every 25 hours until it stops moving, then check before every season.

6. Slide the driveline shields (B) over the yokes at both ends of the driveline, and secure them with clamps (A).

7. Close the cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.
4.5.8 Inspecting Driveline Taper Pins

Taper pins are located at three places (A) along the hitch driveshaft. Torque each pin to 150 Nm (110 lbf·ft) every 25 hours until it no longer moves, and then check at the beginning of every season.

Figure 4.247: Hitch Taper Pin Locations
Taper pins are located at two places (B) on the cross shaft driveline. Torque each pin to 150 Nm (110 lbf·ft) every 25 hours until it no longer moves, and then check at the beginning of every season.

Figure 4.248: Cross Shaft Driveline Taper Pin Locations
4.5.9 Driveline Guards

Removing Driveline Guards

⚠️ WARNING
Do NOT operate the machine without the driveline guards in place and securely fastened.

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

1. Stop engine and remove key from ignition.
2. Remove the driveline (A) from which the guard is going to be removed. Refer to one of the following:
   - Removing Primary Driveline, page 207
   - Removing Hitch Driveline, page 210
   - Removing Clutch Driveline, page 218

3. Remove three self-tapping Phillips head screws (A) from base cone (B).

Figure 4.249: Driveline

Figure 4.250: Phillips Head Screws Installed in Base Cone
MAINTENANCE AND SERVICING

4. Remove base cone (A) and shield tube (B) from driveline (not shown) and outer cone (C).

5. Remove shield support (A) from outer cone (B).

Installing Driveline Guards

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

⚠️ WARNING
Do NOT operate the machine without the driveline guards in place and securely fastened.

1. Stop engine, and remove key from ignition.
2. Grease the bearing groove (A) on the inner yokes.

3. Fit shield support (B) to the bearing groove (A), and ensure that grease fitting (C) faces the drive tube.

4. Install shield support (A) into outer cone (B), and ensure that grease fitting (C) is inserted into the proper hole.

5. Attach the base cone (A) and shield tube (B) to the outer cone (C).
6. Install three self-tapping Phillips head screws (A) into base cone (B).

**NOTE:**
Hand-tighten only using an appropriate screwdriver. Do **NOT** use a powered tool to tighten screws.

**IMPORTANT:**
If installing a replacement guard, ensure chain (A) is short enough that it does **NOT** wrap around the driveline guard.

8. Install the driveline (A). Refer to one of the following:
   - Installing Clutch Driveline, page 219
   - Installing Hitch Driveline, page 213
   - Installing Primary Driveline, page 208
4.5.10 Replacing Conditioner Drive Belt

The conditioner drive belt is located inside the left driveshield and is tensioned with a spring tensioner. The tension is factory-set and should not require adjustment.

Inspecting Conditioner Drive Belt

Check the belt tension and inspect for damage or wear every 100 hours or annually (preferably before the start of the cutting season).

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator's seat for any reason.

1. Lower disc mower fully, turn off engine, and remove key.
2. Open the left side driveshield (A). Refer to 3.2.1 Opening Driveshields, page 33.
3. Inspect drive belt (A) and replace if damaged or cracked.
4. Check that jam nut (B) and adjuster nut (C) are tight.
5. Measure the length of tensioner spring (A), and ensure spring length is 366 mm (14-3/8 in.) in accordance with spring tension decal (B). If spring length requires adjustment, refer to *Installing Conditioner Drive Belt, page 237*.

6. Close driveshield. Refer to *3.2.2 Closing Driveshields, page 35*. 

![Figure 4.261: Spring Tension Decal](image-url)
MAINTENANCE AND SERVICING

Removing Conditioner Drive Belt

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator's seat for any reason.

1. Lower disc mower fully, turn off engine, and remove key.
2. Remove the left driveshield (A). Refer to Removing Driveshields, page 200.

3. Turn jam nut (A) counterclockwise to unlock tension adjustment.
4. Turn jam nut (A) and adjuster nut (B) counterclockwise to fully collapse tensioner spring (C) and release the tension from conditioner drive belt (D).
5. Remove drive belt (D).
**Installing Conditioner Drive Belt**

**DANGER**

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower disc mower fully, turn off engine, and remove key.
2. Install drive belt (A) onto driven pulley (C), and then onto drive pulley (B). Ensure the belt is in the pulley grooves.

**NOTE:**
If necessary, loosen jam nut and adjuster nut (D) to relieve spring tension.

3. Measure the length of tensioner spring (A), and adjust spring length to 366 mm (14-3/8 in.) to match spring tension decal (B).

**NOTE:**
Tensioner springs hook into different locations on different types of conditioners.

4. Increase spring length (tension) by turning adjuster nut (D) clockwise.

5. Once correct spring measurement has been achieved, hold adjuster nut (D) and tighten jam nut (C) against it.

---

### 4.5.11 Servicing Conditioner Roll Timing Gearbox

The conditioner roll timing gearbox, located inside the drive compartment at the right side of the disc mower, transfers power from the gearbox-driven lower roll to the upper roll.

The gearbox (A) does not require routine maintenance or service other than checking and changing the oil.
Checking and Changing Conditioner Roll Timing Gearbox Oil

Change oil after the first 50 hours of operation. Perform subsequent oil changes every 250 hours or annually (preferably before the start of the cutting season).

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator's seat for any reason.

IMPORTANT:
Check the gearbox oil level when the oil is warm. If the oil is cold, idle the machine for approximately 10 minutes prior to checking.

1. Lower mower fully so it is level with the ground, turn off engine, and remove key from ignition.

   NOTE:
   To help ensure an accurate oil level reading for the conditioner roll timing gearbox, set the disc mower’s skid shoes in the fully raised position. Refer to Adjusting Cutting Height, page 80 for instructions.

2. Remove the right driveshield (A). Refer to Removing Driveshields, page 200.

Checking conditioner roll timing gearbox oil level:

3. Clean around oil level plug (A) on inboard side of gearbox.

4. Remove oil level plug (A), and check that oil level is even with the hole.

5. Top up oil level with gear oil if necessary. Refer to this manual’s inside back cover for a list of recommended fluids, lubricants, and capacity.

6. Replace oil level plug (A) and tighten.
Changing conditioner roll timing gearbox oil:

**WARNING**

To avoid bodily injury or death from unexpected start-up or fall of raised machine: stop engine, remove key, and engage lift cylinder lock-out valves before going under machine.

7. Raise mower to provide sufficient access to oil drain plug (A), shut off engine, and remove key.

8. Close the cylinder lock-out valve on each lift cylinder by turning the handle to the closed position (90° angle to the hose). Refer to 3.11.1 Lift Cylinders, page 56.

9. Clean around oil drain plug (A) on bottom of gearbox and around oil level plug (B) on inboard side of gearbox.

10. Place a 1 liter (1.05 qts [US]) container underneath conditioner gearbox.

11. Remove oil drain plug (A) using a hex key.

12. Allow sufficient time for oil to drain, replace oil drain plug (A), and tighten.

13. Remove oil level plug (B) and fill with gear oil until the oil level is even with the bore hole. Refer to this manual’s inside back cover for a list of recommended fluids, lubricants, and capacity.

14. Replace oil level plug (B) and tighten.

15. Properly dispose of oil.

### 4.5.12 Cutterbar-Conditioner Drive Gearbox (T-Gearbox)

The cutterbar-conditioner drive gearbox (T-gearbox) (A), located inside the drive compartment at the left side of the disc mower, transfers power from the header swivel gearbox to the conditioner and cutterbar.

**NOTE:**

If the gearbox requires repair, contact your MacDon dealer.

For service intervals, refer to 4.3.1 Maintenance Schedule/Record, page 112.
Checking and Adding Cutterbar-Conditioner Drive Gearbox (T-Gearbox) (MD #224211)

Lubricant

The cutterbar-conditioner drive gearbox is located inside the drive compartment at the left side of the disc mower.

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Retract the center-link completely.
2. Lower the disc mower until it is level with the ground.

**NOTE:**

To help ensure an accurate oil level reading for the cutterbar-conditioner drive gearbox, set the disc mower’s skid shoes in the fully raised position. Refer to Adjusting Cutting Height, page 80 for instructions.

3. Turn off the engine, and remove the key from the ignition.
4. Detach the tractor from the hitch. Refer to 3.8 Detaching Disc Mower from Tractor, page 49.
5. Open the left driveshield. Refer to 3.2.1 Opening Driveshields, page 33.
6. Adjust the hitch jack (A) until the drive gearbox is parallel to the ground.

7. Clean area around dipstick (A).
8. Remove dipstick (A) using a 22 mm socket.
9. Ensure lubricant level is to the line on dipstick.
10. If necessary, add gear lubricant to gearbox through dipstick hole (A). Refer to the manual’s inside back cover for lubricant information.
11. Reinstall dipstick and tighten.
12. Close left driveshield. For instructions refer to 3.2.2 Closing Driveshields, page 35.
DRAINING CUTTERBAR-CONDITIONER DRIVE GEARBOX (T-GEARBOX) (MD #224211) LUBRICANT

**DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

**IMPORTANT:**

Drain the gearbox lubricant when the lubricant is warm. If the lubricant is cold, idle the machine for approximately 10 minutes prior to draining.

1. Lower disc mower fully, stop engine, and remove key from ignition.

2. Open left side cutterbar door. Refer to **3.3.1 Opening Cutterbar Doors, page 36.**

3. Remove four M10 hex flange head bolts (A) and vertical driveshield (B).
MAINTENANCE AND SERVICING

4. Remove two M10 hex flange head bolts (A) and cover plate (B).

5. Remove four M10 hex flange head bolts (A), top plate (B), and drum top (C).

6. Remove M10 hex flange head bolt (A) and vertical shield (B).
7. Place a 2 liter (2.11 qts [US]) capacity container under drain plug (A), and remove plug using a 17 mm socket.
8. Allow sufficient time for lubricant to drain, replace drain plug (A), and tighten.
9. Properly dispose of used oil.

10. Position vertical shield (B) as shown, and install an M10 hex flange head bolt (A).

11. Position top plate (B) and drum top (C) onto drum as shown, and secure with four M10 hex flange head bolts (A).
12. Install top M10 hex flange head bolt (B) through cover plate (A) and top plate (C).
13. Install lower M10 hex flange head bolt (D) through cover plate (A) and vertical shield (E).
14. Tighten bolts (B) and (D).

15. Install vertical driveshield (B) using four M10 hex flange head bolts (A).

⚠️ **WARNING**

Ensure cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.
16. Close cutterbar doors. Refer to 3.3.3 Closing Cutterbar Doors, page 38.

4.5.13 Header Swivel Gearbox and Hitch Swivel Gearbox

There are two gearboxes located on the disc mower: The header swivel gearbox that transfers power to the disc mower cutterbar and conditioner roll timing gearbox, and the hitch swivel gearbox that transfers power from the tractor to the header swivel gearbox. Both gearboxes consist of upper and lower gearboxes.

If either of the gearboxes requires repair, remove it and have it serviced at your MacDon Dealer.

For service intervals, refer to 4.3.1 Maintenance Schedule/Record, page 112.
Checking Lubricant Levels in the Header Swivel Gearbox and Hitch Swivel Gearbox

Check plugs are located at the same position on each gearbox and need to be removed in order to check the lubricant level. Check lubricant level while lubricant is warm. The lubricant should be visible or slightly draining from the port if filled to the correct level. Refer to 4.3.1 Maintenance Schedule/Record, page 112 for required service intervals.

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

NOTE:
This procedure is the same for both header swivel and hitch swivel gearboxes and must be done on both upper and lower gearboxes.

1. Lower disc mower fully so it is level with the ground, turn off engine, and remove key from ignition.

   NOTE:
   Hitch swivel and header swivel gearbox orientations are not affected by positioning of skid shoes on the disc mower, but ideally the disc mower should be level with the ground prior to checking gearbox oil levels.

2. Clean area around check plug (A).

3. Remove plug using a 15 mm socket. Check lubricant level and ensure lubricant is visible or slightly draining from the port.

4. If lubricant is low, you will need to add some. Refer to Adding Lubricant to the Header Swivel Gearbox (MD #146783) and Hitch Swivel Gearbox (MD #146784), page 249.

5. Reinstall check plug (A) and tighten.

Figure 4.286: Header Swivel or Hitch Swivel Gearbox Check Plug
Draining Lubricant from the Header Swivel Gearbox (MD #146783) and Hitch Swivel Gearbox (MD #146784)

DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

NOTE:

This procedure is the same for both header swivel and hitch swivel gearboxes (MD #146783 and MD #146784), and must be done on both upper and lower gearboxes.

1. Stop engine, and remove key from ignition.
2. Place a 2 liter (2.11 qts [US]) capacity container under drain plug (A), and remove plug using a 17 mm socket.
   
   NOTE:
   
   For faster draining, remove check plug (B).
3. Allow sufficient time for lubricant to drain. Replace drain plug (A) and check plug (B) (if removed), and tighten plugs.
4. Properly dispose of used lubricant and clean up any spills.

Figure 4.287: Gearbox Drain Plug
Adding Lubricant to the Header Swivel Gearbox (MD #146783) and Hitch Swivel Gearbox (MD #146784)

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

NOTE:
This procedure is the same for both header swivel and hitch swivel gearboxes (MD #146783 and MD #146784), and must be done on both upper and lower gearboxes.

1. Stop engine, and remove key from ignition.
2. Clean area around check plug (A) and breather/filler plug (B).
3. Remove check plug (A) and breather/filler plug (B).
4. Ensure lubricant level is visible or begins to drain through check port (A), and add gear lubricant to gearbox through port (B) as required. Refer to this manual’s inside back cover for a list of recommended fluids, lubricants, and capacity.
5. Reinstall check plug (A) and breather/filler plug (B), and tighten.

4.5.14 Wheels and Tires

Checking Wheel Bolts

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

IMPORTANT:
Check and tighten field wheel bolts and transport system wheel bolts (if installed) after the first hour of operation and every 100 hours thereafter.
Torque wheel bolts to 160 Nm (120 lbf·ft) using the tightening sequence shown at right.

**IMPORTANT:**
Whenever a wheel is installed, check torque after one hour of operation.

---

**Removing Wheels**

⚠️ **DANGER**

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator's seat for any reason.

1. Place blocks (A) under opposite wheel to prevent machine from moving if disc mower is not attached to towing vehicle.
2. Position jack under frame leg (B).
3. Loosen wheel bolts slightly.
4. Operate jack to raise wheel off ground.
5. Place blocks or a stand under frame leg.
6. Remove wheel bolts and remove wheel.
Installing Field Wheels

1. Position wheel (A) on the spindle, install bolts (B), and partially tighten.

   **IMPORTANT:**
   Be sure valve stem (C) points away from the wheel support.

2. Lower wheels to the ground and torque wheel bolts to 160 Nm (120 lbf·ft) using the tightening sequence shown at right.

   **IMPORTANT:**
   Whenever a wheel is installed, check torque after one hour of operation.

3. Check tire pressure and adjust as required. Refer to *Inflating Tires, page 251.*

Inflating Tires

**WARNING**

- Service tires safely.
- A tire can explode during inflation which could cause serious injury or death.
Check tire pressure daily:

- Maximum pressure is 310 kPa (45 psi) for field wheels (A)
- Maximum pressure is 552 kPa (80 psi) for optional Road Friendly Transport™ wheels (B)

4.6 Hydraulics

4.6.1 Checking Hydraulic Hoses and Lines

Check hydraulic hoses and lines daily for signs of leaks.

⚠️ WARNING

- Avoid high-pressure fluids. Escaping fluid can penetrate the skin causing serious injury. Relieve pressure before disconnecting hydraulic lines. Tighten all connections before applying pressure. Keep hands and body away from pin holes and nozzles which eject fluids under high pressure.
- If any fluid is injected into the skin, it must be surgically removed within a few hours by a doctor familiar with this type of injury or gangrene may result.

- Use a piece of cardboard or paper to search for leaks.

IMPORTANT:

Keep hydraulic coupler tips and connectors clean. Allowing dust, dirt, water, or foreign material to enter the system is the major cause of hydraulic system damage. Do NOT attempt to service hydraulic systems in the field. Precision fits require a perfectly clean connection during overhaul.
4.6.2 Hydraulic Cylinders

The hydraulic cylinders do not require routine maintenance or service. Occasionally visually inspect cylinders for signs of leaks or damage. If repairs are required, remove them and have them serviced by your MacDon Dealer.

4.7 Servicing Electrical System

4.7.1 Maintaining Electrical System

- Use electrical tape and cable ties as required to prevent wiring harness from dragging or rubbing.
- Keep lights clean and replace defective bulbs.

4.7.2 Servicing Amber Hazard/Signal Lights

Replacing Amber Hazard/Signal Bulb

1. Remove two Phillips screws (A) from fixture, and remove the plastic lens.
2. Replace bulb, and reinstall plastic lens and screws.
   - Bulb—Trade #1157

Replacing Amber Hazard/Signal Light Fixture

1. Cut cable ties (A) securing harness covering to light.
2. Retrieve connections from inside harness covering (approximately 150 mm [6 in.] from light) and disconnect wires (not shown). If necessary, remove tape.
3. Remove four nuts (B) (only 3 shown) securing light to bracket, and remove light. Pull wires through hole in bracket.
4. Feed connectors of new light (not shown) through hole in bracket, and position light onto bracket.
5. Install four nuts (B) and tighten.
6. Connect wires to connectors in harness, and secure harness covering with tape and cable ties (A) as required.
4.7.3 Servicing Red Brake/Tail Lights

Replacing Red Brake/Tail Light Bulb
1. Remove two Phillips screws (A) from fixture, and remove the plastic lens.
2. Replace bulb, and reinstall plastic lens and screws. Bulb—Trade #1157.

Replacing Red Brake/Tail Light Fixture
1. Cut cable ties (A) securing harness covering to light.
2. Retrieve connections from inside harness covering (approximately 150 mm [6 in.] from light) and disconnect wires (not shown). If necessary, remove tape.
3. Remove the four nuts (B) securing light to bracket, and remove light. Pull wires through hole in bracket.
4. Feed connectors of new light (not shown) through hole in bracket, and position light onto bracket.
5. Install four nuts (B) and tighten.
6. Connect wires to connectors in harness, and secure harness covering with tape and cable ties (A) as required.

4.8 Servicing Conditioner

4.8.1 Roll Conditioner
Rolls condition the crop by crimping and crushing the stem in several places, allowing the release of moisture resulting in faster drying times. Both steel and polyurethane conditioner rolls are available. Refer to Chapter 5 Options and Attachments, page 275 for ordering information.

Inspecting Conditioner

⚠️ DANGER
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.
CAUTION

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Lower disc mower fully, stop engine, and remove key.
3. Remove left and right driveshields (A). Refer to 3.2.1 Opening Driveshields, page 33.

4. Inspect conditioner roll left bearing (A) for signs of wear or damage. If bearing needs replacing, contact your dealer.
4.8.2 Finger Conditioner

The finger-type conditioner is most commonly used to harvest grass crops. The finger-type rotor moves the crop across the conditioning baffle which strips away the waxy coating from the plants.

The degree to which the crop is conditioned as it passes through the conditioner is controlled by the clearance between the fingers and the internal intensity baffle (refer to Adjusting Internal Intensity Baffle Clearance, page 98) and by the rotational speed of the fingers (refer to Changing Finger Rotor Speed, page 98).

Inspecting Finger Conditioner

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage header lift cylinder lock-out valves before going under machine for any reason.

⚠️ CAUTION

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.
1. Lower disc mower fully, stop engine, and remove key.

4. Open cutterbar doors. Refer to 3.3.1 Opening Cutterbar Doors, page 36.

5. Check rotor fingers (A) for damage and replace any bent fingers to prevent rotor imbalance.
6. Remove the left driveshield. Refer to Removing Driveshields, page 200.

7. Inspect left side rotor bearing (A) for signs of wear or damage. Contact your MacDon dealer if bearing needs to be replaced.

8. Remove the right driveshield. Refer to Removing Driveshields, page 200.

9. Inspect right side rotor bearing (A) for signs of wear or damage. Contact your MacDon dealer if bearing needs to be replaced.

### 4.8.3 Changing the Conditioner

R113/R116 Pull-Type Disc Mowers can be equipped with either a finger conditioner, a polyurethane roll conditioner, a steel roll conditioner, or no conditioner at all. Follow these instructions to change conditioners.

**NOTE:**
These instructions apply to all conditioners. Exceptions are identified where applicable.
Separating Header from Carrier

DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.

The disc mower includes a header and conditioner attached to a carrier frame. Before removing or installing the conditioner, the header and carrier must be separated.

1. Connect the disc mower to the tractor. Refer to 3.7 Attaching Disc Mower to the Tractor, page 41.

2. Start tractor and center disc mower behind tractor.

3. Raise disc mower fully, set center-link to mid-position, and shut off the engine. Remove key from ignition.

NOTE:
The float adjuster bolt is easier to turn when the disc mower is in the raised position.

4. Close the disc mower lift cylinder lock-out valves (A).

5. Loosen jam nut (B) on adjuster bolt.

6. Turn out adjuster bolt (C) on each float spring until 400 mm (17-3/4 in.) of thread (D) is exposed.
MAINTENANCE AND SERVICING

7. Open lift cylinder lock-out valves (A) (handle in line with the hose).
8. Start the engine and fully lower the disc mower.
9. Stop the engine and remove the key from the ignition.
10. Check that float adjuster bolts (B) are loose. Back off adjuster bolts as required.
11. Remove float adjuster bolt (B) from spring on LEFT side only. Do NOT allow spring to drop when bolt is removed.

12. Open left and right driveshields (A). For instructions, refer to 3.2.1 Opening Driveshields, page 33.

13. On the right side of the disc mower, remove the M20 nut (A), washers, and hex head bolt (B) securing the carrier leg (C) and float spring arm (D) to the header.
14. Move float spring arm (D) clear of conditioner.
15. Remove the M20 nut (A), washers, and hex head bolt (B) securing carrier leg (C) to the left end of the header.

16. Remove clevis pin (A) connecting center-link (B) to anchor (C), and separate center-link from anchor. Reinstall pin in anchor to store.

17. Secure center-link (B) and indicator (D) to carrier frame with a strap or wire to prevent them from contacting the disc mower during separation.

18. Remove two hex head bolts (A) and spacers (B) securing steering arm (C) to gearbox.

19. Lift steering arm (C) off gearbox and secure arm to hitch (D) with a strap or wire.

20. Reinstall hex head bolts (A) and spacers (B) into gearbox.

22. Secure driveline (E) to hitch (D) with a strap or wire.
23. If Road Friendly Transport™ system is installed, disconnect wiring harness (A) at light assembly (B).

24. Remove cable ties (E), clamp (D), and clips (C). Retain for reinstallation.

25. Temporarily attach harness to carrier.

26. Start tractor, slowly back carrier (A) off header (B), and maneuver carrier away from header.

Removing the Conditioner

⚠️ CAUTION

Ensure spreader bar is secured to the forks so that it cannot slide off the forks or towards the mast while detaching the conditioner from the mower.

1. Attach a spreader bar (A) to a forklift or equivalent lifting device, and attach chains to lugs (B) on conditioner. Use a chain rated for overhead lifting with a minimum working load of 1135 kg (2500 lb.).

⚠️ DANGER

To prevent the conditioner from falling backward, ensure lifting chains are secure and tight. Failure to do so may result in death or serious injury.
2. On the left side of the disc mower, remove the conditioner drive belt as follows:
   a. Back off jam nut and tensioner nut (B) on belt idler until belts (A) are loose and can be removed.
   b. Remove the four belts.

3. For finger conditioner, move forward baffle adjustment handle (A) to fully lowered position, as shown.

4. Move rear baffle adjustment handle (B) to fully raised position as shown.
   **NOTE:**
   Access to upper bolts (C) is easiest from the rear of the conditioner.

5. Lift conditioner slightly forward to take load off bolts (A) and to hold the conditioner after the bolts are removed. Retain hardware for reinstallation.
CAUTION

Stand clear when detaching the conditioner.

6. Remove two M16 hex head bolts (A) from each side of conditioner that secure it to mower.

CAUTION

Stand clear when detaching the conditioner.

7. Lift conditioner (A) off disc mower (B), and move it away from work area.

NOTE:

If installing a finger conditioner or if the deflector plates (A) need to be replaced, remove deflector plates (A). Refer to Removing Cutterbar Deflectors, page 84.

NOTE:

If you are replacing a roll conditioner, the deflector plates (A) need to remain installed on the header. Proceed to Installing the Conditioner, page 264.

Installing the Conditioner

CAUTION

Ensure spreader bar is secured to the forks so that it cannot slide off the forks or towards the mast while detaching the conditioner from the mower.
NOTE:
If installing a finger conditioner, deflector plates must be removed. Refer to Removing Cutterbar Deflectors, page 84.

NOTE:
Install deflector plates (A) when installing a roll conditioner and when replacing faulty or damaged deflector plates. Refer to Installing Cutterbar Deflectors, page 85.

NOTE:
If you are replacing a roll conditioner and the deflector plates (A) are already installed on the machine, proceed to Step 1, page 265.

1. Attach a spreader bar (A) to a forklift or equivalent lifting device and attach chains to lugs (B) on the conditioner. Use a chain rated for overhead lifting with a minimum working load of 1135 kg (2500 lb.).

2. Lift conditioner and position it into disc mower opening.

3. Carefully align pin (A) at each end of conditioner with lug (B) on disc mower, and lower conditioner so that pins (A) engage lugs (B) on disc mower.
MAINTENANCE AND SERVICING

4. Align mounting holes and install four M16 x 40 hex head bolts (A) with heads facing inboard (two per side). Secure with M16 center lock flanged nuts and torque to 170 Nm (126 lbf-ft).

5. Remove lifting chains from conditioner and move lifting device clear of work area.

6. If necessary, install conditioner drive components. Refer to Installing Conditioner Drive, page 266.

Installing Conditioner Drive

This procedure describes the installation of conditioner drive components.

If installing a conditioner on the R1 Series Pull-Type Disc Mower, refer to Installing the Conditioner, page 264.

1. Remove two screws (A) from cover (B), and remove cover from gearbox shaft. Retain parts for future use.

2. Assemble pulley (A) and bushing (B) onto gearbox shaft with key (C).

3. Install three M10 hex head bolts (D) through bushing (B) into pulley (A).
4. Tighten the three M10 bolts while maintaining 11 mm (7/16 in.) dimension (B) between pulley (A) and gearbox (C). Torque bolts to 39 Nm (29 lbf·ft).

5. Position tensioner assembly (A) as shown, and secure with M16 x 120 bolt (B) and nut (C). Torque nut (C) to 47–54 Nm (35–40 lbf·ft).

6. Install spring (A) into rear hole (B) for finger conditioner, and forward hole (C) for roll conditioner.

7. Install eyebolt (D) onto tensioner (E) and spring (A). Secure eyebolt with hardened washer (F) and two M10 nuts (G).

NOTE:
Install conditioner drive belt after reattaching header to carrier.

Assembling Header and Carrier

The carrier must be attached to a tractor for the header and carrier to be assembled.

⚠️ DANGER

To avoid bodily injury or death from unexpected startup of machine, always stop engine and remove key from ignition before leaving operator’s seat for any reason.
1. Start the tractor and maneuver carrier (A) directly behind the header (B) so carrier legs line up with the header attachment points.

2. Drive slowly forward to engage the carrier legs (C) into the header attachment brackets.

3. Inspect carrier leg (A) for excess gap between inner steel sleeve of the bushing and the header brackets. If there is a gap, install washer (1.2 mm [0.047 in.] thick) on both sides of the carrier leg to minimize the gap.

4. Align left side carrier leg (A) with header brackets, and install M20 x 40 bolt (B) with hardened washer (C).

5. Install three hardened washers (D) and flanged lock nut (E) on bolt (B).

6. Torque bolt (B) to 339 Nm (250 lbf-ft).

7. Inspect carrier leg (A) for excess gap between inner steel sleeve of the bushing and the header brackets. If there is a gap, install washer (1.2 mm [0.047 in.] thick) to both sides of the carrier leg to minimize the gap.

8. Align right side carrier leg (A) with header brackets, and install M20 x 40 bolt (B) with hardened washer (C).

9. Install hardened washer (D), spacer (E), float tension arm (F), and flanged lock nut (G) on bolt (B).

10. Torque bolt (B) to 339 Nm (250 lbf-ft).
11. Undo strapping or wire supporting driveline to hitch (D), and connect driveline (E) to header swivel gearbox. Refer to Installing Clutch Driveline, page 219.

12. Remove hex head bolts (A) and spacers (B) from gearbox.

13. Undo strapping or wire supporting steering arm to hitch, and position steering arm weldment (C) on gearbox.

14. Secure steering arm to gearbox with spacers (B) and hex head bolts (A). Apply high-strength threadlocker (Loctite® 262 or equivalent) to front holes and torque bolts to 203 Nm (150 lbf-ft).

15. Undo strapping or wire securing center-link (B) and indicator (D) to carrier frame.

16. Remove pins and hardware from anchor (C).

17. Attach center-link (B) and indicator (D) to anchor (C) with clevis pin (A) and secure with cotter pin.

NOTE:
Ensure proper pulley configuration installation—large pulley installed onto gearbox for both roll and finger conditioners.

18. Install conditioner drive belts (A) onto pulleys.

19. Check that tensioner spring is installed at correct location:
   - Hole (D) for roll conditioner
   - Hole (E) for finger conditioner

20. Tighten idler tensioner nut (C) until spring length (B) measures 366 mm (14-3/8 in.).

21. Tighten jam nut.

22. Replace the driveshields. Refer to 3.2.2 Closing Driveshields, page 35.
23. If Road Friendly Transport™ system is installed, reconnect electrical harness (A) to lights (B) and secure harness to shielding using existing clips (C) and (D).

24. Secure harness to light bracket with cable ties (E).

25. Tighten the four M10 hex head bolts (A) and flat washers. Torque to 27–30 Nm (20–22 lbf·ft).

4.9 Replacing Shield (No Conditioner)

4.9.1 Removing Discharge Shield (No Conditioner)

Follow these steps to remove the shielding installed on a mower configured without a conditioner:

1. Raise the mower fully and extend the center-link to maximize the space between shield (A) and carrier frame (B).
2. Close lift cylinder lock-out valves (A) on both sides of the mower. Valve handles should be in the closed position (90 degree angle to the hose).

3. Remove four M16 hex head bolts (A), nuts, and flat washers securing shield (B) to panel on mower (C).

4. Lift the shield (A) until pins (B) disengage from slots in support (C) and shield on panel (D).
4. Rotate shield (A) 90 degrees and move it away from the carrier frame.

4.9.2 Installing Discharge Shield (No Conditioner)

Follow these steps to install the shielding on a disc mower configured without a conditioner:

1. Raise the mower fully and extend the center-link to maximize the space between field wheels (A) and carrier frame (B).

2. Close lift cylinder lock-out valves (A) on both sides of the mower. Valve handles should be in the closed position (90 degree angle to the hose).
3. Rotate shield (A) and pass it between the field wheels and the carrier frame toward the mower.

4. Position shield (A) so that pins (B) engage the slots in cutterbar support (C) and the bolt holes align with panel (D).

5. Install four M16 hex head bolts (A), nuts, and flat washers to secure shield (B) to the panel (C). Ensure bolt heads face inboard.
6. Open lift cylinder lock-out valves (A) on both sides of the mower. Valve handles should be in the open position (inline with the hose).
Chapter 5: Options and Attachments

5.1 Optional Kits

The following kits are available through your MacDon Dealer. The Dealer will require the bundle number for pricing and availability.

5.1.1 Tall Crop Divider Kit

Tall crop dividers attach to the ends of the disc mower for clean crop dividing and cutterbar entry in tall crops. The kit includes left and right dividers and attachment hardware.

MD #B5800

Figure 5.1: Right Side Tall Crop Divider

5.1.2 Hydraulic Center-Link Kit

The Hydraulic Center-Link kit replaces the standard mechanical link and uses a hydraulic cylinder and separate tractor hydraulic circuit to adjust the disc mower angle. The kit includes installation instructions.

MD #B5810

Figure 5.2: Hydraulic Center-Link
5.1.3 Driveline Extension Kit

Some tractor models using a two-point hitch may require a longer primary driveline than the factory-installed driveline on R1 Series Pull-Type Disc Mowers. The Driveline Extension kit can be used to extend the primary driveline length by an additional 152 mm (6 in.).

- B6555 – Full shaft for 1-3/8 in. tractor 1000 RPM PTO
  Extended Length
- B6556 – Full shaft for 1-3/4 in. tractor 1000 RPM PTO
  Extended Length

Figure 5.3: Driveline (B6555 Shown, B6556 Similar)

5.1.4 Tractor Utility Hitch Adapter

The Tractor Utility Hitch Adapter allows the disc mower to connect to a tractor drawbar regardless of installed hitch option (Tractor Two-Point Hitch Adapter or Tractor Drawbar Hitch Adapter). The kit includes the transport hitch, attachment hardware, and safety chain.

MD #B5802

Figure 5.4: Tractor Utility Hitch Adapter
5.1.5 Road Friendly Transport™ System

The Road Friendly Transport™ system allows the disc mower to be towed on roadways while remaining within the legal width restrictions on most roads and highways.

The kit is available as a Dealer-installed option and includes all hardware and installation instructions.

5.1.6 Quick Change Blade Kit

The Quick Change Blade kit allows you to change blades quickly using a blade change tool that separates the disc assembly.

Kits include all hardware and installation instructions. Available for R1 Series factory configured machines with quick-change-ready discs.

- 10 Disc Kit – MD# 257135
- 8 Disc Kit – MD #257136

Chapter 7:  Reference

7.1 Torque Specifications

The following tables provide correct torque values for various bolts, cap screws, and hydraulic fittings.

- Tighten all bolts to torque values specified in charts (unless otherwise noted throughout this manual).
- Replace hardware with same strength and grade of bolt.
- Use torque value tables as a guide and periodically check tightness of bolts.
- Understand torque categories for bolts and cap screws by using their identifying head markings.

**Jam nuts**

When applying torque to finished jam nuts, multiply the torque applied to regular nuts by \( f = 0.65 \).

**Self-tapping screws**

Standard torque is to be used (NOT to be used on critical or structurally important joints).

### 7.1.1 SAE Bolt Torque Specifications

Torque values shown in following tables are valid for non-greased, or non-oiled threads and heads; therefore, do NOT grease or oil bolts or cap screws unless otherwise specified in this manual.

7.1.4 Flare-Type Hydraulic Fittings

1. Check flare (A) and flare seat (B) for defects that might cause leakage.

2. Align tube (C) with fitting (D) and thread nut (E) onto fitting without lubrication until contact has been made between flared surfaces.

3. Torque fitting nut (E) to specified number of flats from finger tight (FFFT) or to a given torque value in Table 7.10, page 290.

4. Use two wrenches to prevent fitting (D) from rotating. Place one wrench on fitting body (D), and tighten nut (E) with other wrench to torque shown.

5. Assess final condition of connection.

\(^{14}\) Torque values shown are based on lubricated connections as in reassembly.
7.1.5 O-Ring Boss (ORB) Hydraulic Fittings (Adjustable)

1. Inspect O-ring (A) and seat (B) for dirt or obvious defects.

2. Back off lock nut (C) as far as possible. Ensure that washer (D) is loose and is pushed toward lock nut (C) as far as possible.

3. Check that O-ring (A) is NOT on threads and adjust if necessary.

4. Apply hydraulic system oil to O-ring (A).

5. Install fitting (B) into port until back up washer (D) and O-ring (A) contact part face (E).

6. Position angle fittings by unscrewing no more than one turn.

7. Turn lock nut (C) down to washer (D) and tighten to torque shown. Use two wrenches, one on fitting (B) and other on lock nut (C).

8. Check final condition of fitting.

7.1.6 O-Ring Boss (ORB) Hydraulic Fittings (Non-Adjustable)

1. Inspect O-ring (A) and seat (B) for dirt or obvious defects.
2. Check that O-ring (A) is NOT on threads and adjust if necessary.
3. Apply hydraulic system oil to O-ring.
4. Install fitting (C) into port until fitting is hand-tight.
5. Torque fitting (C) according to values in Table 7.12, page 293.
6. Check final condition of fitting.

\(^{16}\) Torque values shown are based on lubricated connections as in reassembly.
7.1.7 O-Ring Face Seal (ORFS) Hydraulic Fittings

1. Check components to ensure that sealing surfaces and fitting threads are free of burrs, nicks, scratches, or any foreign material.

2. Apply hydraulic system oil to O-ring (B).

3. Align tube or hose assembly so that flat face of sleeve (A) or (C) comes in full contact with O-ring (B).

4. Thread tube or hose nut (D) until hand-tight. The nut should turn freely until it is bottomed out.

5. Torque fittings according to values in Table 7.13, page 294.

   **NOTE:**
   If applicable, hold hex on fitting body (E) to prevent rotation of fitting body and hose when tightening fitting nut (D).

6. Use three wrenches when assembling unions or joining two hoses together.

7. Check final condition of fitting.

7.1.8  Tapered Pipe Thread Fittings

Assemble pipe fittings as follows:

1. Check components to ensure that fitting and port threads are free of burrs, nicks and scratches, or any form of contamination.

2. Apply pipe thread sealant (paste type) to external pipe threads.

3. Thread fitting into port until hand-tight.

4. Torque connector to appropriate torque angle. The Turns From Finger Tight (TFFT) values are shown in Table 7.14, page 295. Make sure that tube end of a shaped connector (typically 45 degree or 90 degree) is aligned to receive incoming tube or hose assembly. Always finish alignment of fitting in tightening direction. Never back off (loosen) pipe threaded connectors to achieve alignment.

5. Clean all residue and any excess thread conditioner with appropriate cleaner.

6. Assess final condition of fitting. Pay special attention to possibility of cracks to port opening.

7. Mark final position of fitting. If a fitting leaks, disassemble fitting and check for damage.

**NOTE:**

Overtorque failure of fittings may not be evident until fittings are disassembled.

Recommended Lubricants

Keep your machine operating at top efficiency by using only clean lubricants and by ensuring the following:

- Use clean containers to handle all lubricants.
- Store lubricants in an area protected from dust, moisture, and other contaminants.

**IMPORTANT:**

Do NOT overfill the cutterbar when adding lubricant. Overfilling could result in overheating and failure of cutterbar components.
