Noise Levels

The A-weighted sound pressure level inside the operator’s station of a typical self-propelled vehicle (e.g., M1240), when operated in conjunction with this R216 Rotary Disc Header, is 70 dBA. This measurement was taken in accordance with ISO 5131. The sound pressure level depends upon the rotary disc speed, crop conditions, as well as the exact type of self-propelled vehicle used to power the R216 Rotary Disc Header.
Introduction

This instructional manual contains safety, operating, and maintenance procedures for the MacDon R216 Rotary Disc Header. The rotary disc header when attached to a MacDon M1240 Windrower, is designed to cut, condition, and lay a wide variety of grasses and hay crops in windrows.

Carefully read all the material provided before attempting to unload, assemble, or use the machine.

Use this manual as your first source of information about the machine. If you follow the instructions provided in this manual, and use MacDon parts, the rotary disc header will work well for many years. If you require more detailed service information, contact your Dealer.

Use the Table of Contents and the Index to guide you to specific topics. Study the Table of Contents to familiarize yourself with how the material is organized. Keep this manual handy for frequent reference and to pass on to new Operators or Owners. Call your Dealer if you need assistance, information, or additional copies of this manual.

When setting up the machine or making adjustments, review and follow the recommended machine settings in all relevant MacDon publications. Failure to do so may compromise machine function and machine life and may result in a hazardous situation.

MacDon provides warranty for Customers who operate and maintain their equipment as described in this manual. A copy of the MacDon Industries Limited Warranty Policy, which explains this warranty, should have been provided to you by your Dealer. Damage resulting from any of the following conditions will void the warranty:

- Accident
- Misuse
- Abuse
- Improper maintenance or neglect
- Abnormal or extraordinary use of the machine
- Failure to use the machine, equipment, component, or part in accordance with the manufacturer’s instructions

Conventions

The following conventions are used in this document:

- Right and left are determined from the operator’s position. The front of the rotary disc header faces the crop.
- Unless otherwise noted, use the standard torque values provided in this manual.

Store the operator’s manual and the parts catalog in the plastic manual case (A) on the left fixed deflector.

NOTE: Keep your MacDon publications up-to-date. The most current version can be downloaded from our website www.macdon.com or from our Dealer-only site (https://portal.macdon.com) (login required).
## Summary of Changes

At MacDon, we’re continuously making improvements, and occasionally these improvements affect product documentation. The following list provides an account of major changes from the previous version of this document.

Chapter 1: Safety

1.1 Safety Alert Symbols

This safety alert symbol indicates important safety messages in this manual and on safety signs on the machine.

This symbol means:

- **ATTENTION!**
- **BECOME ALERT!**
- **YOUR SAFETY IS INVOLVED!**

Carefully read and follow the safety message accompanying this symbol.

**Why is safety important to you?**

- Accidents disable and kill
- Accidents cost
- Accidents can be avoided

![Figure 1.1: Safety Symbol](image-url)
1.2 Signal Words

Three signal words, DANGER, WARNING, and CAUTION, are used to alert you to hazardous situations. Two signal words, IMPORTANT and NOTE, identify non-safety related information. Signal words are selected using the following guidelines:

⚠️ DANGER

Indicates an imminently hazardous situation that, if not avoided, will result in death or serious injury.

⚠️ WARNING

Indicates a potentially hazardous situation that, if not avoided, could result in death or serious injury. It may also be used to alert against unsafe practices.

⚠️ CAUTION

Indicates a potentially hazardous situation that, if not avoided, may result in minor or moderate injury. It may be used to alert against unsafe practices.

IMPORTANT:

Indicates a situation that, if not avoided, could result in a malfunction or damage to the machine.

NOTE:

Provides additional information or advice.
1.3 General Safety

⚠️ CAUTION

The following general farm safety precautions should be part of your operating procedure for all types of machinery.

Protect yourself when assembling, operating, and servicing machinery, wear all protective clothing and personal safety devices that could be necessary for the job at hand. Do NOT take chances. You may need the following:

- Hard hat
- Protective footwear with slip-resistant soles
- Protective glasses or goggles
- Heavy gloves
- Wet weather gear
- Respirator or filter mask
- Be aware that exposure to loud noises can cause hearing impairment or loss. Wear suitable hearing protection devices such as earmuffs or earplugs to help protect against loud noises.

- Provide a first aid kit in case of emergencies.
- Keep a properly maintained fire extinguisher on the machine. Be familiar with its proper use.
- Keep young children away from machinery at all times.
- Be aware that accidents often happen when the Operator is tired or in a hurry. Take time to consider safest way. NEVER ignore warning signs of fatigue.
• Wear close-fitting clothing and cover long hair. NEVER wear dangling items such as scarves or bracelets.

• Keep all shields in place. NEVER alter or remove safety equipment. Make sure driveline guards can rotate independently of shaft and can telescope freely.

• Use only service and repair parts made or approved by equipment manufacturer. Substituted parts may not meet strength, design, or safety requirements.

• Keep hands, feet, clothing, and hair away from moving parts. NEVER attempt to clear obstructions or objects from a machine while the engine is running.

• Do NOT modify the machine. Unauthorized modifications may impair machine function and/or safety. It may also shorten the machine’s life.

• To avoid injury or death from unexpected startup of the machine, ALWAYS stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

• Keep service area clean and dry. Wet and/or oily floors are slippery. Wet spots can be dangerous when working with electrical equipment. Be sure all electrical outlets and tools are properly grounded.

• Keep work area well lit.

• Keep machinery clean. Straw and chaff on a hot engine are fire hazards. Do NOT allow oil or grease to accumulate on service platforms, ladders, or controls. Clean machines before storage.

• NEVER use gasoline, naphtha, or any volatile material for cleaning purposes. These materials may be toxic and/or flammable.

• When storing machinery, cover sharp or extending components to prevent injury from accidental contact.
1.4 Maintenance Safety

To ensure your safety while maintaining machine:

- Review the operator’s manual and all safety items before operation and/or maintenance of the machine.

- Place all controls in Neutral, stop the engine, set the park brake, remove the ignition key, and wait for all moving parts to stop before servicing, adjusting, and/or repairing.

- Follow good shop practices:
  - Keep service areas clean and dry
  - Be sure electrical outlets and tools are properly grounded
  - Keep work area well lit

- Relieve pressure from hydraulic circuits before servicing and/or disconnecting the machine.

- Make sure all components are tight and that steel lines, hoses, and couplings are in good condition before applying pressure to hydraulic systems.

- Keep hands, feet, clothing, and hair away from all moving and/or rotating parts.

- Clear the area of bystanders, especially children, when carrying out any maintenance, repairs, or adjustments.

- Install transport lock or place safety stands under the frame before working under the machine.

- If more than one person is servicing the machine at the same time, be aware that rotating a driveline or other mechanically-driven component by hand (for example, accessing a lubricant fitting) will cause drive components in other areas (belts, pulleys, and knives) to move. Stay clear of driven components at all times.

- Wear protective gear when working on the machine.

- Wear heavy gloves when working on knife components.
1.5 Hydraulic Safety

- Always place all hydraulic controls in Neutral before leaving the operator’s seat.
- Make sure that all components in the hydraulic system are kept clean and in good condition.
- Replace any worn, cut, abraded, flattened, or crimped hoses and steel lines.
- Do NOT attempt any makeshift repairs to hydraulic lines, fittings, or hoses by using tapes, clamps, cements, or welding. The hydraulic system operates under extremely high-pressure. Makeshift repairs will fail suddenly and create hazardous and unsafe conditions.

- Wear proper hand and eye protection when searching for high-pressure hydraulic leaks. Use a piece of cardboard as a backstop instead of hands to isolate and identify a leak.
- If injured by a concentrated high-pressure stream of hydraulic fluid, seek medical attention immediately. Serious infection or toxic reaction can develop from hydraulic fluid piercing the skin.

- Make sure all components are tight and steel lines, hoses, and couplings are in good condition before applying pressure to a hydraulic system.
1.6 Welding Precaution

Welding should never be attempted on the header while it is connected to a windrower.

⚠️ WARNING

Severe damage to sensitive, expensive electronics can result from welding on the header while it is connected to the windrower. It can be impossible to know what effect high current could have with regard to future malfunctions or shorter lifespan. It is very important that welding on the header is not attempted while the header is connected to the windrower.

If an Operator needs to do any welding on the header, it should first be disconnected and removed from the windrower. If it is unfeasible to disconnect the header from the windrower before attempting welding, contact your MacDon Dealer for welding precautions detailing all electrical components that must be disconnected first for safe welding.
1.7 Safety Signs

- Keep safety signs clean and legible at all times.
- Replace safety signs that are missing or illegible.
- If the original part on which a safety sign was installed is replaced, be sure the repair part displays the current safety sign.
- Replacement safety signs are available from Dealer Parts Department.

1.7.1 Installing Safety Decals

1. Clean and dry the installation area.
2. Decide exactly where you are going to place the decal.
3. Remove the smaller portion of the split backing paper.
4. Place the decal in position and slowly peel back the remaining paper, smoothing the decal as it is applied.
5. Prick small air pockets with a pin and smooth out.
1.8 Locating Safety Decals

1.9 Understanding Safety Signs

NOTE:
This is a general list of safety sign definitions and the decals listed may not necessarily be applicable to your machine.

**MD #190546**
Slippery surface

**WARNING**—*DO NOT STEP ON SURFACE*
- Do **NOT** use this area as a step or platform.
- Failure to comply could result in serious injury or death.

**MD #307746**
Thrown/sharp object hazard

**WARNING**
- Crop materials exiting at high speed.
- Stop machine, look, listen, and wait for all movement to stop before approaching.
- Failure to comply could result in death or serious injury.
- Disengage power take-off, shut off tractor, and remove key before opening covers.
- Listen and look for evidence of rotation before lifting cover.
- Cutters may continue to rotate after power is shut off due to inertia.

**MD #325070**
Pinch/tangle hazard

**WARNING**
- Guard missing. Do **NOT** operate.
- Keep all shields in place.
- To avoid entanglement with rotating auger, stand clear of header while machine is running.
- Failure to comply could result in serious injury or death.
MD #325706

Thrown and sharp object/hydraulic oil pressure hazard

WARNING

- Crop materials exiting at high speed.
- Stop machine, look, listen, and wait for all movement to stop before approaching.
- Failure to comply could result in death or serious injury.
- Disengage power take-off, shut off tractor, and remove key before opening covers.
- Listen and look for evidence of rotation before lifting cover.
- Cutters may continue to rotate after power is shut off due to inertia.
- Read the operator’s manual, and follow all safety instructions. If you do not have a manual, obtain one from your Dealer.
- Do NOT allow untrained persons to operate the machine.
- Review safety instructions with all Operators annually.
- Ensure that all safety signs are installed and legible.
- Make certain everyone is clear of machine before starting engine, and during operation.
- Keep riders off the machine.
- Keep all shields in place and stay clear of moving parts.
- Disengage drive, put transmission in Neutral, and wait for all movement to stop before leaving operator’s position.
- Shut off engine and remove key from ignition before servicing, adjusting, lubricating, cleaning, or unplugging machine.
- Engage locks to prevent lowering of self-propelled rotary disc header before servicing in the raised position.
- Use slow moving vehicle emblem and flashing warning lights when operating on roadways unless prohibited by law.
- High pressure oil easily punctures skin causing serious injury, gangrene, or death.
- If injured, seek emergency medical help.
- Do NOT use finger or skin to check for leaks.
- Lower load or relieve hydraulic pressure before loosening fittings.
# Chapter 2: Product Overview

## 2.1 Specifications

NOTE:
Specifications and design are subject to change without notice or obligation to revise previously sold units.

<tr>
<td>Soft joint</td>
<td>A joint made with use of a fastener where joining materials are compressible or experience relaxation over a period of time</td>
</tr>
<tr>
<td>SP rotary disc header</td>
<td>Rotary disc header that connects to a self-propelled machine (windrower, etc.)</td>
</tr>
<tr>
<td>Tension</td>
<td>Axial load placed on a bolt or screw, usually measured in Newtons (N) or pounds (lb.)</td>
</tr>
<tr>
<td>TFFT</td>
<td>Turns from finger tight</td>
</tr>
<tr>
<td>Torque</td>
<td>The product of a force X lever arm length, usually measured in Newton-meters (Nm) or foot-pounds (lbf-ft)</td>
</tr>
<tr>
<td>Torque angle</td>
<td>A tightening procedure where fitting is assembled to a precondition (finger tight) and then nut is turned farther a number of degrees to achieve its final position</td>
</tr>
<tr>
<td>Torque-tension</td>
<td>The relationship between assembly torque applied to a piece of hardware and axial load it induces in bolt or screw</td>
</tr>
<tr>
<td>Washer</td>
<td>A thin cylinder with a hole or slot located in the center that is to be used as a spacer, load distribution element, or locking mechanism</td>
</tr>
<tr>
<td>Windrower</td>
<td>Power unit for a header</td>
</tr>
</tbody>
</table>
Chapter 3:  Operation

3.1 Break-In Period

After attaching the header to the windrower for the first time, operate the machine slowly for 5 minutes, watching and listening from the operator’s seat for binding or interfering parts.

NOTE:
Until you become familiar with the sound and feel of your new header, be extra alert and attentive.

⚠️ CAUTION

Before investigating an unusual sound or attempting to correct a problem, stop the engine, put the ground speed lever (GSL) in PARK, and remove the key.

NOTE:
Perform the items specified in 4.4.2 Break-In Inspections, page 78.
3.2 Engaging and Disengaging Header Safety Props

Safety props are located on both header lift cylinders on the windrower.

3.2.1 Engaging and Disengaging Header Safety Props – M1240 Windrower

Safety props are located on both header lift cylinders on the windrower. Follow these steps to engage or disengage the header safety props:

⚠️ DANGER

To avoid bodily injury from fall of raised header, always engage safety props when working on or around raised header, and before going under header for any reason.

1. Start the engine.
2. Press the HEADER UP (A) switch to raise header to maximum height.

   **NOTE:**
   If one end of the header does *NOT* fully raise, rephase the lift cylinders as follows:
   a. Press and hold the HEADER UP switch (A) until both cylinders stop moving.
   b. Continue to hold the switch for 3–4 seconds. Cylinders are now phased.
3. Shut down the engine, and remove the key from the ignition.
4. Engage the safety props on both lift cylinders as follows:
   a. Pull lever (A) toward you to release, and then rotate toward header to lower the safety prop onto the cylinder.
   b. Repeat for the opposite lift cylinder.

   **IMPORTANT:**
   Ensure the safety props engage over the cylinder piston rods. If the safety prop does not engage properly, raise the header until the safety prop fits over the rod.
5. Disengage the safety props on both lift cylinders as follows:

**NOTE:**
If the safety prop will not disengage, raise the header to release the prop.

a. Turn lever (A) away from the header to raise the safety prop until the lever locks into the vertical position.

b. Repeat for the opposite cylinder.

6. Start the engine.

7. Lower the header fully.

8. Shut down the engine, and remove the key from the ignition.
3.3 Attaching Rotary Disc Header to M1240 Windrower

3.3.1 Installing Forming Shield

⚠️ WARNING

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Stop engine, and remove key from ignition.
2. Position forming shield (A) in between windrower legs as shown.
3. Remove lynch pin (B) and clevis pin (C).
4. Mount forming shield (A) to bolts and spacers (D).

5. Secure forming shield (C) to bolts and spacers (D) using clevis pin (B) and lynch pin (A). Repeat at the opposite side.
6. Remove lynch pin (A) and washer (B) from straight pin (C).

7. Attach rubber strap (D) to straight pin (C) at the rear of windrower leg. Secure with washer (B) and lynch pin (A).
3.3.2 Attaching Header to M1240 Windrower

The windrower may have an optional self-aligning hydraulic center-link that allows vertical position control of the center-link from the cab.

⚠️ WARNING

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. **Hydraulic Center-Link without Self-Alignment:** Remove pin (A) and raise center-link (B) until hook is above the attachment pin on header. Replace pin (A) to hold center-link in place.

   **IMPORTANT:**
   If the center-link is too low, it may contact the header as the windrower approaches the header for hookup.

2. Remove hairpin (A) from clevis pin (B), and remove pin from header support (C) on both sides of the header.

3. Lift header support (A) and place 2 x 4 in. blocks (B) under the header support. A total of four 2 x 4 in. blocks (B) will be necessary to raise the boot up into field position. Ensure the boot’s bottom edge (C) is parallel with the ground.

   **NOTE:**
   Do NOT stack blocks (B) crosswise as doing so can make the header unstable when attempting to connect the header and windrower. Stack blocks (B) parallel with each other.

4. Repeat Step 3, page 24 on opposite side.

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.
5. Start the windrower engine. For instructions, refer to the windrower operator’s manual.

⚠️ CAUTION
When lowering header lift legs without a header or weight box attached to the windrower, ensure the float springs tension is fully released to prevent damage to the header lift linkages.

NOTE:
If not prompted by the Harvest Performance Tracker (HPT) display to remove float, remove float manually. For instructions, refer to windrower operator’s manual for instructions.

6. Press rotary scroll knob (A) on display to highlight QuickMenu options.

7. Rotate scroll knob (A) to highlight the HEADER FLOAT symbol (B), and press scroll knob to select. The header float adjust screen displays.

8. Press soft key 3 (A) to remove the header float.

NOTE:
If the header float is active, the icon at soft key 3 will display REMOVE FLOAT; if header float has been removed, the icon will display RESUME FLOAT.
9. Press HEADER DOWN switch (E) on ground speed lever (GSL) to fully retract header lift cylinders.

10. **Self-Aligning Hydraulic Center-Link:** Press REEL UP switch (B) on the GSL to raise the center-link until the hook is above the attachment pin on the header.

   **IMPORTANT:**
   If the center-link is too low, it may contact the header as the windrower approaches the header for hookup.

11. Drive the windrower slowly forward until feet (A) enter supports (B). Continue to drive slowly forward until feet engage the supports and header nudges forward.

12. Ensure feet (A) are properly engaged in supports (B).

13. **Self-Aligning Hydraulic Center-Link:**
   
   a. Adjust the position of center-link cylinder (A) with the switches on the GSL until hook (B) is above the header attachment pin.

   **IMPORTANT:**
   Hook release (C) must be down to enable the self-locking mechanism.

   b. If hook release (C) is open (up), shut down the engine, and remove the key from the ignition. Manually push hook release (C) down after the hook engages the header pin.

   c. Lower center-link (A) onto the header with REEL DOWN switch on the GSL until the center-link locks into position and hook release (C) is down.

   d. Check that center-link is locked onto header by pressing the REEL UP switch on the GSL.
14. **Hydraulic Center-Link without Self-Alignment**:
   a. Press HEADER TILT UP or HEADER TILT DOWN cylinder switches on the GSL to extend or retract center-link cylinder until the hook is aligned with the header attachment pin.
   b. Shut down the engine, and remove the key from the ignition.
   c. Push down on rod end of link cylinder (B) until hook engages and locks onto header pin.

   **IMPORTANT:**
   Hook release must be down to enable self-locking mechanism. If the hook release is open (up), manually push it down after hook engages pin.
   d. Check that center-link (A) is locked onto header by pulling upward on rod end (B) of cylinder.

   **CAUTION**
   Check to be sure all bystanders have cleared the area.
   e. Start the engine.

15. Press HEADER UP switch (A) to raise the header to maximum height.

   **NOTE:**
   If one end of the header does **NOT** fully raise, rephase the lift cylinders as follows:
   a. Press and hold HEADER UP switch (A) until both cylinders stop moving.
   b. Continue to hold the switch for 3–4 seconds. Cylinders are now phased.

16. Shut down the engine, and remove the key from the ignition.

17. Engage the safety props on both lift cylinders as follows:
   a. Pull lever (A) toward you to release, and then rotate toward header to lower the safety prop onto the cylinder.
   b. Repeat for the opposite lift cylinder.

   **IMPORTANT:**
   Ensure the safety props engage over the cylinder piston rods. If the safety prop does not engage properly, raise the header until the safety prop fits over the rod.
18. Install clevis pin (A) through support and windrower lift arm and secure with hairpin (B). Repeat for the opposite side of the header.

**IMPORTANT:**
Ensure clevis pin (A) is fully inserted, and hairpin is installed behind bracket.

19. Disengage the safety props on both lift cylinders as follows:

**NOTE:**
If the safety prop will not disengage, raise the header to release the prop.

a. Turn lever (A) away from the header to raise the safety prop until the lever locks into the vertical position.

b. Repeat for the opposite cylinder.

20. Start the engine and press HEADER DOWN switch (A) on GSL to fully lower header.

**NOTE:**
If not prompted by the HPT display to restore float, restore float manually.

21. Shut down the engine, and remove the key from the ignition.
3.3.3 Connecting R216 SP Hydraulics and Electrical to an M1240 Windrower

The R216 SP hydraulics connection procedure varies depending on the windrower configuration:

- Draper header ready windrowers include one set of hydraulic quick couplers which are compatible with the header drive hoses on the R216 SP. One additional set of quick couplers (MD #B6277) is required.
- Rotary disc header ready windrowers include hard plumbed hydraulics connections.

**NOTE:**
Quick couplers can be installed if desired on disc-only configured windrowers – two sets of quick coupler bundle B6277 are required to do so.

**IMPORTANT:**
To prevent contamination of the hydraulic system, use a clean rag to remove dirt and moisture from all (fixed and movable) hydraulic couplers.

1. Open the windrower’s left platform. For instructions, refer to windrower operator’s manual.
2. Using a clean rag, remove dirt and moisture from the couplers on the left side of the windrower frame.
3. Retrieve hydraulic hoses (A) from the header and route the hose bundle under the windrower frame.

**NOTE:**
Adding anti-seize to the hose holder pin will make future removal easier.

4. Insert pin (B) into hole (C) in windrower frame.

**IMPORTANT:**
Route hydraulic hoses as straight as possible, and avoid rub/wear points that could damage the hoses. To prevent damage, hoses should have enough slack to pass by the multicoupler bracket without contact. To adjust hose slack, loosen hose holder (B) on the front windrower leg, adjust hoses, then retighten the hose holder.

5. Remove protective plugs (A) from the ends of the hydraulic hoses.
Proceed with the steps that are relevant to the following windrower configurations:

<table>
<thead>
<tr>
<th>Windrower Configuration</th>
<th>Steps for Connecting Hydraulics and Electrical</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rotary disc/draper ready configuration (A)</td>
<td>Steps 6, page 30 to 9, page 31</td>
</tr>
<tr>
<td>Rotary disc only hard plumbed configuration (B)</td>
<td>Step 10, page 32 to 11, page 32</td>
</tr>
<tr>
<td>Rotary disc ready configuration (B) with quick couplers installed</td>
<td>Steps 12, page 32 to 17, page 34</td>
</tr>
</tbody>
</table>

**Rotary disc/draper ready configuration with quick couplers:**

6. Ensure hose (A) is disconnected from windrower receptacle (B) and placed in storage cup (C) on multicoupler.
7. Connect hydraulic fittings to the hydraulic hoses as follows:
   a. Attach 90° elbow fitting (A) and 1 in. female coupler fitting (B) to disc pressure hose (C).
   b. Attach 90° elbow fitting (A) and 1 in. male coupler fitting (D) to disc return hose (E).

8. Connect the hydraulic hoses to the windrower with quick coupler fittings as follows:
   a. Connect disc pressure hose (A) with coupler (B) and torque to 205–226 Nm (151–167 lbf·ft).
   b. Connect disc return hose (C) with coupler (D) and torque to 205–226 Nm (151–167 lbf·ft).
   c. Connect case drain hose (E) to fitting (F), with relief valve pointing towards the ground.

   **NOTE:**
   If required, loosen fitting (F) and retighten as needed to ensure relief valve is pointing straight down as shown.

9. To connect electrical harness, refer to Steps 18, page 34 to 21, page 35.
Hard plumbed fittings – rotary disc ready configuration:

10. Connect the hydraulic hoses to the windrower with hard plumbed fittings as follows:
   a. Connect disc pressure hose (A) marked with a red cable tie (B) to hard plumb fitting marked with a red cable tie (C) and torque to 205–226 Nm (151–167 lbf·ft).
   b. Connect disc return hose (D) to hard plumb fitting (E) and torque to 205–226 Nm (151–167 lbf·ft).
   c. Connect case drain hose (F) to fitting (G).

11. To connect electrical harness, refer to Steps 18, page 34 to 21, page 35.

Quick coupler fittings – rotary disc ready configuration:

12. Connect hydraulic fittings to the hydraulic hoses as follows:
   a. Attach 90° elbow fitting (A) and 1 in. female coupler fitting (B) to disc pressure hose (C).
   b. Attach 90° elbow fitting (A) and 1 in. male coupler fitting (D) to disc return hose (E).
13. Remove the extension fittings and elbows (A) from the rotary disc header hydraulic pressure and return connections.

14. Install the male quick coupler at windrower pressure receptacle (A).

15. Install the female quick coupler with adapter at windrower return receptacle (B).
16. Connect the hydraulic hoses to the windrower with quick coupler fittings as follows:
   a. Connect disc pressure hose (A) with coupler (B) and torque to 205–226 Nm (151–167 lbf·ft).
   b. Connect disc return hose (C) with coupler (D) and torque to 205–226 Nm (151–167 lbf·ft).
   c. Connect case drain hose (E) to fitting (F), with relief valve pointing towards the ground.

   **NOTE:**
   If required, loosen fitting (F) and retighten as needed to ensure relief valve is pointing straight down as shown.

17. To connect electrical harness, refer to Steps 18, page 34 to 21, page 35.

   To connect electrical harness, follow these steps:

   18. Free electrical harness (A) from adjustable strap (B).
19. Connect main header harness (A) to adapter harness (B).

20. Connect electric baffle control harness (C) to adapter harness (D) if installed.

21. Check electrical connection (A) at the windrower.

22. Close the windrower’s left platform. For instructions, refer to the windrower operator’s manual.
3.4 Detaching Header from Windrower

3.4.1 Detaching R216 Rotary Disc Header from M1240 Windrower

**WARNING**

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

**CAUTION**

Check to be sure all bystanders have cleared the area.

1. Start the engine, and press switch (A) to lower the header to the ground.
2. Shut down the engine, and remove the key from the ignition.
3. Open the left platform. For instructions, refer to the windrower operator’s manual.
4. Disconnect hydraulic hoses (A), (B), and (C) from the windrower.
5. Install caps and plugs on open lines to prevent buildup of dirt and debris while in storage.

---

**Figure 3.37: GSL**

**Figure 3.38: Header Drive Hydraulics**
6. Remove hose support (A) and hose bundle from windrower frame.

7. Rest hydraulic hose bundle (A) on header for storage as shown.

8. Disconnect main header harness (A) from adapter harness (B).

9. Disconnect electric baffle control harness (C) from adapter harness (D) if installed.
10. Secure adapter harness (A) on the center link with an adjustable strap (B).

11. Remove hairpin (B) from clevis pin (A). Remove clevis pin from header support (C) on both sides of header.

Windrowers with center-link self-alignment kit only:

12. Release center-link latch (A) before returning to the cab.
OPERATION

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.

13. Start the engine.

14. Remove header float when prompted by the Harvest Performance Tracker (HPT).

**NOTE:**

If not prompted by the HPT to remove float, remove float manually.

**Self-aligning center-link (if installed):**

15. Use HEADER TILT cylinder switches (A) on GSL to release load on center-link cylinder.

16. Operate the link lift cylinder with REEL UP switch (B) to disengage the center-link from the header.

![Figure 3.45: GSL](image)

**Non-self-aligning center-link:**

17. Shut down the engine, and remove the key from the ignition.

18. Lift hook release (A) and lift hook (B) off header pin.

⚠️ CAUTION

Check to be sure all bystanders have cleared the area.

19. Start the engine.

![Figure 3.46: Hydraulic Center-Link](image)
20. Back the windrower slowly away from header.
21. Reinstall clevis pin (A) through support (C) and secure with hairpin (B). Repeat for opposite side.

3.4.2 Removing Forming Shield

⚠️ WARNING
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Stop engine, and remove key from ignition.
2. Remove and retain hairpin (A) and washer (B) from straight pin (C).
3. Pull rubber strap (D) away from straight pin (C).
4. Lower rear end of endshield.
5. Reinstall washer (B) and hairpin (A) on straight pin (C) for storage.
6. Repeat Steps 2, page 40 to 5, page 40 at the opposite side.
7. Remove lynch pin (A) and clevis pin (B) securing forming shield (C) to bolts and spacers (D). Repeat at the opposite side.

8. Dismount forming shield (A) from bolts and spacers (B).

9. Reattach clevis pin and lynch pin to the forming shield for storage.

10. Remove forming shield.
3.5 Driveshields

Driveshields protect drive components from damage and provide access to drive components for maintenance and servicing. Driveshields are located on the left and right ends of the header.

3.5.1 Opening Driveshields

⚠️ CAUTION

To reduce the risk of personal injury, do NOT operate the machine without the driveshields in place and secured.

NOTE:
Images shown in this procedure are for the left driveshield—the right driveshield is similar.

1. Push down on release lever (A) to disengage the release latch and pull handle (B).

Figure 3.51: Left Driveshield

Figure 3.52: Driveshield Latch and Handle
2. Lift the outboard driveshield panel toward the outboard end of the header.

3. Grab handle (A) and lift the other half of endshield (B) to the inboard side of the header.
3.5.2 Closing Driveshields

⚠️ CAUTION

To reduce the risk of personal injury, do NOT operate the machine without the driveshields in place and secured.

NOTE:
Images shown in this procedure are for the left driveshield—the right driveshield is similar.

1. Lift lock latch (A) to disengage driveshield lock.

2. Move inboard half of driveshield (A) back to closed position.

3. Move outboard half of driveshield (A) back to closed position.
3.6 Cutterbar Curtain

⚠️ WARNING
To reduce the risk of personal injury and machine damage, do NOT operate the machine without curtain installed and in good condition. Foreign objects can be ejected with considerable force when the machine is started.

NOTE:
Cutterbar curtain is attached at the front and the sides of the header. ALWAYS keep curtain lowered when operating the disc header.

IMPORTANT:
Replace curtain (A) if it becomes worn or damaged. For instructions, refer to 4.9.1 Inspecting Cutterbar Curtain, page 155.

3.6.1 Opening Cutterbar Curtain

⚠️ WARNING
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Push curtain (A) inward and up.

Figure 3.58: Cutterbar Curtains

Figure 3.59: Cutterbar Curtain
2. Secure curtain in place at locations (A) using three clips provided.

NOTE:
Cutterbar curtain (A) is held in place between the tines of retaining clips (B).

3.6.2 Closing Cutterbar Curtain

⚠️ CAUTION
To avoid injury, keep hands and fingers away from corners of doors when closing.

1. Pull curtain outward from retaining clips and lower curtain.
3.7 Header Settings

Satisfactory operation of the disc header in all situations requires making proper adjustments to suit various crops and conditions.

Correct operation reduces crop loss and increases productivity. Proper adjustments and timely maintenance increases the length of service of the machine.

The variables listed in the following table and detailed in this manual, affect the performance of the disc header. Most of the adjustments have been set at the factory, but settings can be changed to suit your crop conditions.

Table 3.1 Header Operating Variables

<table>

</tbody>
</table>

3.7.1 Cutting Height

Cutting height is determined by a combination of the cutterbar angle and the optional skid shoe or gauge roller settings. Adjust the cutting height for optimum cutting performance and to prevent build-up inside the disc header. Excessive build-up of mud and soil can lead to poor crop flow and increased wear on cutting components.

Optional adjustable gauge rollers and skid shoes are available to provide different cutting heights. For instructions, refer to:

- Adjusting Skid Shoe Height, page 48
- Adjusting Gauge Roller Height, page 49

Lowering the skid shoes (or gauge rollers) and decreasing the cutterbar angle increases the cutting height, resulting in higher stubble that helps material dry faster. This may be desirable in stony conditions to help reduce damage to cutting components.

Raising the skid shoes (or gauge rollers) and increasing also the cutterbar angle decreases the cutting height, resulting in a shorter stubble.

To choose a header angle that maximizes performance for your crop and field conditions, refer to 3.7.2 Adjusting Cutterbar Angle, page 52.

To minimize cutterbar damage, scooping soil, and soil build-up at the cutterbar in damp conditions, the float should be set as light as possible without causing excessive bouncing. For instructions, refer to 3.7.3 Header Float, page 52.
Adjusting Skid Shoe Height

Adjustable skid shoes are available to provide different cutting heights.

The adjustable skid shoes have three position settings: lowest working position (A), intermediate working position (B), and storage position (C).

To adjust skid shoe height, follow these steps:

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

1. Raise the header fully, shut off the engine, and remove the key from the ignition.

2. Engage the lift cylinder safety props.

3. Remove the lynch pin and the clevis pin from both sides of the skid shoe.

4. Position the skid shoe in the preferred working position. This example shows the lowest working position. Align skid shoe holes (A) with mounting holes in bracket (B).
5. Replace the clevis pins and lynch pins (A) to secure the skid shoe in place.

**IMPORTANT:**
Install lynch pins (A) at the inboard side of the skid shoe.

6. Repeat the procedure on the second skid shoe. Ensure both skid shoes are set to the same position.

7. Adjust the cutterbar angle to the desired working position using the disc header angle controls. If the angle is not critical, set it to mid-position. For instructions, refer to 3.7.2 Adjusting Cutterbar Angle, page 52.

8. Check the header float. For instructions, refer to the windrower operator’s manual.

**Adjusting Gauge Roller Height**

Optional adjustable gauge rollers are available to provide different cutting heights.

**NOTE:**
The left gauge roller is shown in the illustrations in this procedure. The right gauge roller is opposite.

The gauge roller has three position settings: lowest working position, intermediate working position, and storage position.

**Lowest working position**
To adjust the gauge rollers to the lowest working position, follow these steps:

**DANGER**
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

1. Raise the header fully, shut off the engine, and remove the key from the ignition.

2. Engage the lift cylinder safety props.

3. Remove two lynch pins (A) and clevis pins (B) from the gauge roller plate.

4. Remove scraper plate (C) and lynch pin (D).
5. Swing the gauge roller forward and align the holes in the gauge roller plate to the bottom hole of the mounting plates.

6. Secure with clevis pins (A) and lynch pins (B).

**IMPORTANT:**
Lynch pins (B) should be installed at the inboard side of the gauge roller.

---

**Intermediate working position**

To adjust the gauge rollers to the intermediate position, follow these steps:

1. Support the gauge roller, and remove two lynch pins (B) and clevis pins (A).

2. Swing the gauge roller upward and align the holes in the gauge roller plate to the top holes in the mounting plates.

3. Secure with clevis pins (A) and lynch pins (B).

**IMPORTANT:**
Lynch pins (B) should be installed at the inboard side of the gauge roller.
**Storage position**

To adjust the gauge roller to the storage position, follow these steps:

1. Remove lynch pins (B) and clevis pins (A).
2. Remove lynch pin (C) and scraper plate (D).
3. Swing gauge roller (A) fully backward, and reinstall scraper plate (B) in slot.

**IMPORTANT:**
The scraper plate should be installed from the outboard side with its tab facing down as shown.

4. Secure plate (A) with lynch pin (B) as shown.
5. Reinstall clevis pins (C) and lynch pins (D) for storage.

**IMPORTANT:**
Lynch pins (D) should be installed at the inboard side of the gauge roller.

6. Ensure both gauge rollers are in the same position.
3.7.2 Adjusting Cutterbar Angle

Header angle (A) adjustment ranges from 0 to 8° below horizontal. Choose an angle that maximizes performance for your crop and field conditions. A flatter angle provides better clearance in stony conditions, while a steeper angle is required in downed crops for better lifting action.

Check the float after significantly adjusting the header angle because the adjustments affect the header float due to shifting the header center of gravity. Refer to your windrower operator’s manual for instructions.

NOTE:
An angle of 3 to 5° on the HPT display is suitable for most conditions. At steep header angles (7 to 10°) the cut pattern of the discs will become apparent, leaving a variation in stubble height between discs.

3.7.3 Header Float

The M1240 float is completely adjustable from the cab through the Harvest Performance Tracker (HPT).

The header float feature allows the header to closely follow ground contours and respond quickly to sudden changes or obstacles. The float setting is ideal when the cutterbar is on the ground with minimal bouncing, scooping, or pushing soil.

IMPORTANT:
- Set header float as light as possible—without excessive bouncing—to avoid frequent breakage of knife components, scooping soil, or soil build-up at the cutterbar in wet conditions.
- Avoid excessive bouncing (resulting in a ragged cut) by operating at a slower ground speed when the float setting is light.
- Install applicable header options (crop dividers, etc.) before setting header float.
- Adjust the float when adding or removing optional attachments that affect the weight of the header.
- Changing header angle affects the float. Check the float after making appropriate changes to header angle for crop type and conditions, field conditions, and speed settings.

For instructions on setting and adjusting the header float, refer to your windrower operator’s manual.
3.7.4 Ground Speed

Choose a ground speed that allows the cutterbar to cut the crop smoothly and evenly. Try different combinations of disc speed and ground speed to suit your specific crop. Refer to your windrower operator’s manual for instructions on changing ground speed.

⚠️ CAUTION

Reduce speed when turning, crossing slopes, or traveling over rough ground.

In tough cutting conditions (such as native grasses), set the disc speed to MAXIMUM.

In light crops, reduce the disc header’s disc speed while maintaining ground speed.

**NOTE:**

Operating the disc header at the minimum disc speed will extend the wear life of cutting components.

The chart below indicates the relationship between ground speed and area cut.

**Figure 3.74: Ground Speed for R216 Rotary Disc Headers**

![Graph showing the relationship between ground speed and area cut.]

A - Acres/Hour  B - Hectares/Hour  C - Kilometers/Hour  D - Miles/Hour

**Example:** At ground speed of 21 km/h (13 mph) the area cut would be approximately 25 acres (12 hectares) per hour.
3.8 Conditioner

Rolls condition the crop by crimping and crushing the stem in several places, which allows the release of moisture resulting in faster drying times. There are two roll conditioner options—steel conditioner rolls and polyurethane rolls.

3.8.1 Roll Gap

The roll gap controls the degree to which crop is conditioned as it passes through the rolls. Roll gap is factory-set at approximately 6 mm (1/4 in.) for steel rolls, and 3 mm (1/8 in.) for polyurethane rolls.

Steel rolls can be operated over a large range of roll gap settings (intermesh). Using a roll gap of (up to) 25 mm (1 in.), they are suited to a wide range of crops (including alfalfa and thicker-stemmed cane-type crops). However operating with too large of a gap may cause feeding problems.

Grass-type crops may require less gap for proper feeding and conditioning.

**IMPORTANT:**

If using settings below the factory setting, visually inspect the roll gap to ensure that there is no metal-to-metal contact between the upper and lower rolls.

*Adjusting Roll Gap – Steel Rolls*

To adjust the roll gap, follow the procedure below:

**WARNING**

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the header fully.
2. Shut down the engine, and remove the key from the ignition.
3. Loosen jam nut (A) on both sides of the conditioner.
4. Turn lower nut (B) counterclockwise until the upper roll rests on the lower roll. Ensure the rolls intermesh.
5. Turn lower nut (B) clockwise to increase gap or counterclockwise to decrease gap.

**NOTE:**

Make further adjustments to roll gap based on header performance and crop conditions.

6. Hold nut (B) and tighten jam nut (A) on both sides of the disc header.

**IMPORTANT:**

Make sure the roll gap adjustment nuts are adjusted equally on both sides of the disc header to achieve a consistent gap across the rolls.
Adjusting Roll Gap – Polyurethane Rolls

To adjust the roll gap, follow the procedure below:

⚠️ WARNING

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the header fully.
2. Shut down the engine, and remove the key from the ignition.
3. Loosen jam nut (A) on both sides of the conditioner.
4. Turn lower nut (B) counterclockwise until the upper roll rests on the lower roll.
5. Turn lower nut (B) clockwise to increase gap or counterclockwise to decrease gap.

NOTE:
Make further adjustments to roll gap based on header performance and crop conditions.

6. Hold nut (B) and tighten jam nut (A) on both sides of the header.

IMPORTANT:
Make sure the roll gap adjustment nuts are adjusted equally on both sides of the header to achieve a consistent gap across the rolls.

Figure 3.76: Roll Gap Adjustment – Left Side Shown
3.8.2 Roll Tension

Roll tension (the pressure holding the conditioner rolls together) is factory-set to maximum and should rarely require adjustment.

Heavy crops or tough forage can cause the rolls to separate; therefore, maximum roll tension is required to ensure that materials are sufficiently crimped.

Adjusting Roll Tension

To adjust roll tension, follow these steps:

**WARNING**

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the header to the ground.
2. Shut down the engine, and remove the key from the ignition.
3. Loosen jam nut (A) on both sides of the conditioner.
4. Adjust spring drawbolt as follows:
   - Turn spring drawbolt (B) clockwise to tighten spring and **INCREASE** the roll tension.
   - Turn spring drawbolt (B) counterclockwise to loosen spring and **DECREASE** the roll tension.

**IMPORTANT:**

Turn each bolt equally. Roll tension changes by approximately 32 N (7.2 lbf) with each turn of the drawbolt.

5. Measure the amount of exposed thread on spring drawbolt (A) at each end of the conditioner. Measurement (B) should be 12–15 mm (1/2–9/16 in.).
6. Tighten jam nut (C) on both sides of the conditioner.
3.8.3 Roll Timing

For proper conditioning, the rolls must be properly timed with the bar on one roll centered between two bars on the other roll. The factory setting should be suitable for most crop conditions.

IMPORTANT:
Roll timing is critical when the roll gap is decreased because conditioning is affected and the bars may contact each other.

Checking Roll Timing
Check roll timing if excessive noise is coming from the conditioner rolls.

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

Roll timing is factory-set and should not require adjustment; however, if there is excessive noise coming from the conditioner rolls, the timing may need to be adjusted. For instructions, refer to Adjusting Roll Timing, page 57.

Adjusting Roll Timing

⚠️ WARNING
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Shut down the engine, and remove the key from the ignition.

2. On the right side of the header, engage lift release latch (A) and pull handle (B) to open outboard driveshield (C).

3. Lift at handle (D) to open inboard driveshield (E).
4. On the upper roll, loosen four bolts (A) securing yoke plate (B).

**NOTE:**
Only three of the four bolts are shown in the illustration.

5. Secure bottom roll (A).
6. Manually rotate upper roll (B) counterclockwise as shown until it stops rotating.
7. Make a mark (C) across yoke (D) and gearbox flange (E).
8. Manually rotate upper roll (A) clockwise until it stops rotating. Make a second mark (B) on the yoke flange, and align it with the mark on the gearbox flange.

9. Determine center point (A) between the two marks on the yoke plate, and place a third mark.

10. Rotate upper roll (B) counterclockwise, until the bolt lines up with the third (center) mark.
11. Remove one of the four bolts (A), ensure threads are clean and free of lubricant.

**NOTE:**
Only three of the four bolts are shown in the illustration.

12. Apply medium-strength threadlocker (Loctite® 242 or equivalent) and tighten bolt (A). Torque to 95 Nm (70 lbf-ft).

13. Repeat Steps 11, page 60 to 12, page 60 for the other three bolts.

14. Close the right driveshields.

*Figure 3.85: Conditioner Drive*
3.8.4 Forming Shields – Roll Conditioner

WARNING
Keep everyone at a safe distance from your operation. Ensure bystanders are never in line with the front or rear of the machine. Stones or other foreign objects can be ejected from either end with force.

The forming shield position controls the width and placement of the windrow. Consider the following factors when setting the forming shield position:

- Weather conditions (rain, sun, humidity, and wind)
- Type and yield of crop
- Available drying time
- Method of processing (bales, silage, and green-feed)

A wider windrow will generally dry faster and more evenly, resulting in less protein loss. Fast drying is especially important in areas where the weather allows only a few days to cut and bale. A narrower windrow may be preferable for ease of pick-up and when drying is not critical (for example, when cutting for silage or green feed).

Positioning Forming Shield Side Deflectors – Roll Conditioner

The position of the side deflectors controls the width and placement of the windrow. To ensure windrow placement is centered between the carrier wheels, adjust the left and right deflectors to the same position.

WARNING
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Set forming shield side deflectors (A) to the desired width by repositioning adjuster handle (B). To ensure windrow placement is centered, adjust both side deflectors to the same position.

Figure 3.86: Forming Shield Side Deflector and Adjuster Handle
**Positioning Rear Baffle – Roll Conditioner**

**NOTE:**
This procedure is used to manually position the rear baffle on headers that are NOT equipped with the Electric Remote Baffle kit (MD #B6664).

The rear baffle is used in conjunction with the forming shields to affect the windrow width. It is located immediately behind and above the conditioning rolls and can be positioned to do the following:

- Direct crop flow into forming shield for narrow and moderate width windrows.
- Direct crop downward to form a wide swath.
- Provide even material distribution across windrow with adjustable fins under rear baffle. For instructions, refer to *Positioning Rear Baffle Deflector Fins, page 63*.

To position the rear baffle, follow these steps:

⚠️ **WARNING**
To avoid injury or death from unexpected start-up of machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Remove lynch pin (A) securing rear baffle adjustment lever (B) to bracket (C).
2. Pull rear baffle adjustment lever (B) inboard to disengage from bracket (C).
3. Position rear baffle adjustment lever (B) as follows:
   - Move the lever forward to raise the baffle
   - Move the lever backward to lower the baffle
4. Release rear baffle adjustment lever (B) so that the tab engages the hole in bracket (C).
5. Secure baffle adjustment lever (B) with lynch pin (A).

**NOTE:**
An optional remote baffle adjustment kit (MD #B6664) is available for R216 SP. For more information, refer to *5.4 Electric Remote Baffle Kit – MD #B6664, page 174*.

Figure 3.87: Left Side of Conditioner
Positioning Rear Baffle Deflector Fins

Four rear baffle deflector fins are located under the baffle. Fins are factory-configured to approximately 60°. The rear baffle deflector fins help spread the crop in the windrow.

To adjust fins, follow these steps:

⚠️ WARNING

To avoid injury or death from unexpected start-up of machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Deflector fins (A) are located on the underside of the rear baffle.

   **NOTE:**
   There are two fins on the left and two fins on the right of the header.

2. To adjust deflector fins (A), loosen existing bolt and nut (B). Once adjusted to the desired angle for windrow width, torque nut to 57.5 Nm (42 lbf·ft).

3. Repeat for the opposite deflector fins.

   **NOTE:**
   Fins may interfere with crop flow in large-stemmed crops, or when using the double windrower attachment. It may be necessary to remove fins in these conditions.
NOTE:
Deflector fins (A) can be put in storage position by removing existing nut and bolt and reattaching fins on top of the baffle.

Figure 3.90: Left Deflector Fins in Storage Position
3.9 Cutterbar Deflectors

A two-piece cutterbar deflector kit (MD #B6847) is available for attaching to the cutterbar just below the header’s conditioner rolls. Deflectors provide improved feeding into the conditioner rolls and prevent heavy crop with long stems from feeding under the rolls.

Cutterbar deflectors may not be well-suited for some crop and field conditions. Refer to the following table:

<table>
<thead>
<tr>
<th>Crop/Field Condition</th>
<th>Use Deflector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average crop/normal field conditions</td>
<td>No</td>
</tr>
<tr>
<td>Long-stemmed and heavy/normal field conditions</td>
<td>Yes</td>
</tr>
<tr>
<td>Long-stemmed and heavy/sandy soil</td>
<td>No</td>
</tr>
<tr>
<td>Long-stemmed and heavy/gopher mounds or rocks (refer to the note below table)</td>
<td>No</td>
</tr>
</tbody>
</table>

**NOTE:**
Removing the deflector helps feed dirt/rocks through the header and prevents debris build up, wear and damage from rocks.

3.9.1 Removing Cutterbar Deflectors

⚠ **DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, always stop engine and remove key before leaving the operator’s seat, and always engage safety props before going under the machine for any reason.

1. Raise the header fully.
2. Shut down the engine, and remove the key from the ignition.
4. Locate deflectors (A) and (D) on the back of the cutterbar.
5. Clean debris from deflectors and deflector area.
6. Remove bolt (B) from the cutterbar on outboard end of deflector. Retain the hardware.
7. Remove three bolts (C) and nuts securing deflector (A) to the cutterbar. Remove deflector (A).
8. Reinstall removed bolts (B) and (C), and nuts on the deflector for storage.
9. Repeat above steps for the left deflector (D).
10. Store the deflectors in a safe place.
11. If the cutterbar is being replaced, install the deflectors on the new cutterbar. For instructions, refer to 3.9.2 Installing Cutterbar Deflectors, page 66.
3.9.2 Installing Cutterbar Deflectors

The cutterbar deflectors are used with roll conditioners only.

⚠ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, always stop engine and remove key before leaving the operator’s seat, and always engage safety props before going under the machine for any reason.

1. Raise the header fully.
2. Shut down the engine, and remove the key from the ignition.
4. Clean debris from ledge and the six mounting holes along aft edge of cutterbar.
5. Position left deflector (A) on the aft edge of the cutterbar, and align the slots in deflector plate (A) with the existing fasteners and cutterbar plug.

**NOTE:**
Some parts removed from illustration for clarity.
6. Apply medium-strength threadlocker (Loctite® 243 or equivalent) to M8 hex flange head bolt (B), and then loosely install at the outboard end of deflector plate (A).
7. Loosely secure deflector plate (A) to the cutterbar with three M10 carriage bolts and lock nuts (C). Insert the bolts into the cutterbar from the bottom.

8. Position right deflector (A) on right aft edge of the cutterbar, and loosely secure in place with three M10 carriage bolts and lock nuts (C). Insert the bolts into the cutterbar from the bottom.

**NOTE:**
Some parts removed from illustration for clarity.
9. Apply medium-strength threadlocker (Loctite® 243 or equivalent) to M8 hex flange head bolt (B), and then loosely install at the outboard end of deflector plate (A).
10. Align right deflector plate (A) with left deflector plate (D).
11. Tighten all six nuts (three securing each deflector plate) to 39 Nm (29 lbf-ft).
12. Tighten the two M8 bolts (at the outboard ends of the deflector plates) to 29 Nm (21 lbf-ft).
3.10 Haying Tips

3.10.1 Curing

Curing crops quickly helps maintain the highest quality of crop material as 5% of protein is lost from hay for each day that it lays on the ground after cutting.

Leaving the windrow as wide and fluffy as possible results in the quickest curing. Cured hay should be baled as soon as possible.

3.10.2 Topsoil Moisture

Table 3.3 Topsoil Moisture Levels

<table>
<thead>
<tr>
<th>Level</th>
<th>% Moisture</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wet</td>
<td>Over 45%</td>
<td>Soil is muddy</td>
</tr>
<tr>
<td>Damp</td>
<td>25–45%</td>
<td>Shows footprints</td>
</tr>
<tr>
<td>Dry</td>
<td>Under 25%</td>
<td>Surface is dusty</td>
</tr>
</tbody>
</table>

- On wet soil, the general rule of wide and thin does not apply. A narrower windrow will dry faster than hay left flat on wet ground.
- When the ground is wetter than the hay, moisture from the soil is absorbed by the hay above it. Determine topsoil moisture level before cutting. Use a moisture tester or estimate level.
- If ground is wet due to irrigation, wait until soil moisture drops below 45%.
- If ground is wet due to frequent rains, cut hay when weather allows and let the forage lie on wet ground until it dries to the moisture level of the ground.
- Cut hay will dry only to the moisture level of the ground beneath it, so consider moving the windrow to drier ground.

3.10.3 Weather and Topography

- Cut as much hay as possible by midday when drying conditions are best.
- Slopes that face the sun receive up to 100% more exposure to the sun’s heat than slopes that do not face the sun. If hay is baled and chopped, consider baling sun-facing slopes and chopping slopes that do not.
- When relative humidity is high, the evaporation rate is low and hay dries slowly.
- Humid air is trapped around the windrow in calm conditions. Raking or tedding will expose the hay to fresher and drier air.
- Cut hay perpendicular to the direction of the prevailing winds if possible.
3.10.4 Windrow Characteristics

Producing windrows with the recommended characteristics will achieve the best results. Refer to 3 Operation, page 19 for instructions on adjusting the header.

Table 3.4 Recommended Windrow Characteristics

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Advantage</th>
</tr>
</thead>
<tbody>
<tr>
<td>High and fluffy</td>
<td>Enables airflow through windrow, which is more important to the curing</td>
</tr>
<tr>
<td></td>
<td>process than direct sunlight</td>
</tr>
<tr>
<td>Consistent formation (not bunching)</td>
<td>Permits an even flow of material into the baler, chopper, etc.</td>
</tr>
<tr>
<td>Even distribution of material across</td>
<td>Results in even and consistent bales to minimize handling and stacking</td>
</tr>
<tr>
<td>windrow</td>
<td>problems</td>
</tr>
<tr>
<td>Properly conditioned</td>
<td>Prevents excessive leaf damage</td>
</tr>
</tbody>
</table>

3.10.5 Driving on Windrow

Driving on previously cut windrows that will not be raked can lengthen drying time by a full day. If practical, set forming shields to produce a narrower windrow that the machine can straddle.

NOTE:
Driving on the windrow in high-yield crops may be unavoidable if a full width windrow is necessary.

3.10.6 Using Chemical Drying Agents

Hay drying agents work by removing wax from legume surfaces and allowing moisture to escape cut crop and evaporate faster; however, treated hay lying on wet ground will absorb ground moisture faster.

Before deciding to use a drying agent, carefully compare the relative costs and benefits for your area.
3.11  Transporting the Header

For information on transporting the header when attached to the windrower, refer to your windrower operator’s manual.
Chapter 4: Maintenance and Servicing

The following instructions provide information about routine servicing for the header. A parts catalog is located in a plastic case on the fixed deflector on the left side of the header.

Log hours of operation and use the maintenance record provided (refer to 4.4.1 Maintenance Schedule/Record, page 76) to keep track of your scheduled maintenance.

4.1 Daily Start-Up Check

⚠️ CAUTION

- Ensure the windrower and the header are properly attached, all controls are in neutral, and the windrower brakes are engaged.
- Clear the area of other persons, pets etc. Keep children away from machinery. Walk around to make sure no one is under, on, or close to it.
- Wear close-fitting clothing and protective shoes with slip resistant soles. As well, carry with you any protective clothing and personal safety devices that could be necessary throughout the day. Don't take chances.
- Remove foreign objects from the machine and surrounding area.

Protect yourself. You may need the following:

- A hard hat
- Protective footwear with slip-resistant soles
- Protective glasses or goggles
- Heavy gloves
- Wet weather gear
- A respirator or filter mask

Use proper hearing protection:

Be aware that exposure to loud noise can cause impairment or loss of hearing. Wear suitable hearing protection such as earmuffs or earplugs to help protect against loud noises.
Perform the following checks each day before startup:

1. Check the machine for leaks or any parts that are missing, broken, or not working correctly.
   
   **NOTE:**
   Use proper procedure when searching for pressurized fluid leaks. Refer to *4.13.1 Checking Hydraulic Hoses and Lines, page 170*.

2. Clean all lights and reflective surfaces on the machine, and check lights for proper operation.

3. Perform all daily maintenance. Refer to *4.4.1 Maintenance Schedule/Record, page 76*.

Figure 4.3: Safety around Equipment
4.2 Preparing Machine for Servicing

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, always stop engine and remove key before leaving the operator’s seat, and always engage safety props before going under the machine for any reason.

⚠️ CAUTION

To avoid personal injury, perform the following procedures before servicing disc header or opening drive covers:

1. Lower the header fully. If you need to perform service in the raised position, always engage safety props. For instructions, refer to 3.2.1 Engaging and Disengaging Header Safety Props – M1240 Windrower, page 20.

2. Put the ground speed lever (GSL) in PARK.

3. Stop the engine and remove the key from the ignition.

4. Wait for all moving parts to stop.
4.3 Recommended Safety Procedures

- Park on level surface when possible. Follow all recommendations in your windrower operator’s manual.
- Wear close-fitting clothing and cover long hair. Never wear dangling items such as scarves or bracelets.
- Wear protective shoes with slip-resistant soles, a hard hat, protective glasses or goggles, and heavy gloves.
- Be aware that if more than one person is servicing the machine at the same time, rotating a driveline or other mechanically driven component by hand (for example, to access a lube fitting) will cause drive components in other areas (belts, pulleys, and discs) to move. Stay clear of driven components at all times.
• Be prepared if an accident should occur. Know where the first aid kits and fire extinguishers are located, and know how to use them.

• Keep the service area clean and dry. Wet or oily floors are slippery. Wet spots can be dangerous when working with electrical equipment. Be sure all electrical outlets and tools are properly grounded.

• Use adequate light for the job at hand.
• Reinstall all shields removed or opened for service.
• Use only service and repair parts made or approved by the equipment manufacturer. Substituted parts may not meet strength, design, or safety requirements.
• Keep machinery clean. Never use gasoline, naphtha, or any volatile material for cleaning purposes. These materials may be toxic and/or flammable.
4.4 Maintenance Requirements

IMPORTANT:
Recommended intervals are for average conditions. Service the machine more often if operating under adverse conditions (severe dust, extra heavy loads, etc.).

Regular maintenance is the best insurance against early wear and untimely breakdowns. Following the maintenance schedule will increase your machine’s life. Periodic maintenance requirements are organized according to service intervals.

If more than one interval is specified for a service item (e.g., 100 hours or annually), service the machine at whichever interval is reached first.

When servicing the machine, refer to the specific headings in this section. Refer to this manual’s inside back cover and use only the specified fluids and lubricants.

Log hours of operation, use the maintenance record, and keep copies of your maintenance records. Refer to 4.4.1 Maintenance Schedule/Record, page 76.

⚠️ CAUTION
Carefully follow all safety messages. Refer to 4.3 Recommended Safety Procedures, page 74.

4.4.1 Maintenance Schedule/Record

Keep a record of maintenance as evidence of a properly maintained machine. Daily maintenance records are not required to meet normal warranty conditions.

## MAINTENANCE AND SERVICING

### Every 25 Hours
- ✧ Lubricate idler pivot. Refer to 4.5 Lubrication, page 80.
- ✧ Lubricate upper and lower driveline universal joints. Refer to 4.5 Lubrication, page 80.
- ✧ Lubricate roller conditioner and feed roller bearings. Refer to 4.5 Lubrication, page 80.
- ✧ Lubricate conditioner driveline. Refer to 4.5 Lubrication, page 80.

### Every 100 Hours or Annually
- ✔ Check conditioner drive belt tension. Refer to Inspecting Conditioner Drive Belt, page 160.
- ✔ Check roll timing gearbox lubricant. Refer to 4.7.1 Checking and Changing Conditioner Roll Timing Gearbox Oil, page 149.
- ✔ Check header drive gearbox lubricant. Refer to 4.8.1 Checking Oil in Header Drive Gearbox, page 152

### Every 250 Hours²
- ▲ Change roll timing gearbox lubricant. Refer to 4.7.1 Checking and Changing Conditioner Roll Timing Gearbox Oil, page 149.
- ▲ Change header drive gearbox lubricant. Refer to 4.8.2 Changing Oil in Header Drive Gearbox, page 154
- ▲ Change cutterbar lubricant. Refer to 4.6.1 Lubricating Cutterbar, page 83.
- ✧ Lubricate left and right driven drums. Refer to Removing Left Driven Drum and Driveline, page 126 and Removing Right Driven Drum and Driveline, page 132

---

² Begins after the first 150 hour service.

4.4.3 Preseason Servicing

⚠️ CAUTION

- Review the operator's manual to refresh your memory on safety and operating recommendations.
- Review all safety signs and other decals on the self-propelled disc header and note hazard areas.
- Ensure all shields and guards are properly installed and secured. Never alter or remove safety equipment.
- Make certain you understand and have practiced safe use of all controls. Know the capacity and the operating characteristics of the machine.
- Check the first aid kit and fire extinguisher. Know where they are and how to use them.

Perform the following procedures at the beginning of each operating season:

1. Lubricate machine completely. For instructions, refer to 4.5 Lubrication, page 80 and 4.6.1 Lubricating Cutterbar, page 83.
2. Perform all annual maintenance. For instructions, refer to 4.4.1 Maintenance Schedule/Record, page 76.
4.4.4 End-of-Season Servicing

**WARNING**

To avoid injury or death from unexpected start-up of machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

**CAUTION**

Never use gasoline, naphtha, or any volatile material for cleaning purposes. These materials may be toxic and/or flammable.

**CAUTION**

Cover cutterbar to prevent injury from accidental contact.

Perform the following procedures at the end of each operating season:

1. Raise the header and engage lift cylinder safety props.
2. Clean the header thoroughly.
3. Check for worn components and repair as necessary.
4. Check for broken components and order replacements from your Dealer. Immediate repair of these items will save time and effort at beginning of next season.
5. Replace or tighten any missing or loose hardware. For instructions, refer to [7.1 Torque Specifications, page 187](#).
6. Lubricate the header thoroughly leaving excess grease on fittings to keep moisture out of bearings.
7. Apply grease to exposed threads, cylinder rods, and sliding surfaces of components.
8. Oil cutterbar components to prevent rust.
9. Loosen drive belt.
10. Remove divider rods (if equipped) to reduce space required for inside storage.
11. Repaint all worn or chipped painted surfaces to prevent rust.
12. Store in a dry, protected place if possible. If stored outside, always cover header with a waterproof canvas or other protective material.
4.5 Lubrication

⚠️ WARNING

To avoid personal injury, before servicing header or opening drive covers, refer to 4.2 Preparing Machine for Servicing, page 73.

Greasing points are marked on the machine by decals on the left and right outboard shielding.

Log hours of operation and use the maintenance schedule provided to keep a record of scheduled maintenance. Refer to 4.4.1 Maintenance Schedule/Record, page 76.

4.5.1 Greasing Procedure

Only use clean, high temperature, extreme pressure grease. Refer to this manual’s inside back cover for a list of recommended fluids and lubricants.

⚠️ WARNING

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Shut down the engine, and remove the key from the ignition.
2. Open driveshields at the ends of the header to access greasing points. For instructions, refer to 3.5.1 Opening Driveshields, page 42.
3. Wipe grease fitting with a clean cloth before greasing to avoid injecting dirt and grit.
4. Replace any loose or broken fittings immediately.
5. Inject grease through fitting with grease gun until grease overflows fitting (except where noted).
6. Leave excess grease on fitting to keep out dirt.
7. Remove and thoroughly clean any fitting that will not take grease and clean lubricant passageway. Replace fitting if necessary.
4.5.2 Lubrication Locations

Figure 4.9: Left Side Lubrication Locations

A - Idler/Tensioner Pivot
B - Bearing, Roller Conditioner (Two Places)
C - U-Joint, Conditioner Driveline (Two Places)
D - Slip Joint, Conditioner Driveline
E - Idler/Tensioner Pivot
F - Bearing, Feed Roll
G - Tensioner Arm

3. Use high-temperature, extreme-pressure (EP2) performance grease with 10% max molybdenum disulphide (NLGI grade 2) lithium base.
MAINTENANCE AND SERVICING

Figure 4.10: Right Side Lubrication Locations

A - Bearing, Roller Conditioner (Two Places)
B - U-Joint, Upper Driveline (Two Places)
C - Slip Joints, Conditioner Drivelines
D - U-Joint, Lower Driveline (Two Places)
E - Idler Pivot

4. Use high-temperature, extreme-pressure (EP2) performance grease with 10% max molybdenum disulphide (NLGI grade 2) lithium base.
4.6 Cutterbar System

Check and change the lubricant at regular intervals. For instructions, refer to 4.4 Maintenance Requirements, page 76.

IMPORTANT:
Warm cold lubricant by idling the machine for 10 minutes prior to checking level.

4.6.1 Lubricating Cutterbar

Checking and Adding Lubricant in Cutterbar

WARNING
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

WARNING
Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Park the machine on level ground.
2. Lower the header onto 25 cm (10 in.) blocks under both ends of the cutterbar.
3. Shut down the engine, and remove the key from the ignition.
5. Use a spirit (bubble) level (A) to ensure the cutterbar is level in both directions. Adjust the header accordingly.

6. Clean the area around plug (A). Place a 5 liter (5.2 US qts) capacity container under plug (A).

7. Use a 17 mm socket to remove plug (A) and gasket (B) from cutterbar. Oil level must be up to the inspection plug hole. If additional lubricant is required, continue following this procedure and refer to the next step. If additional lubricant is **NOT** required, proceed to Step 22, page 85.

8. Reinstall the inspection plug.

**CAUTION**

Before starting the machine, check to be sure all bystanders have cleared the area.

9. Start the engine, and raise the header slightly.

10. Lower the header onto blocks, so the right end is slightly higher than left end.

11. Shut down the engine, and remove the key from the ignition.
12. Remove plug (A) at the right end of the header.
   **IMPORTANT:**
   Do **NOT** remove bolts (B).

13. Add lubricant to the required level.
   **IMPORTANT:**
   Do **NOT** overfill the cutterbar. Overfilling can cause overheating, damage, or cutterbar component failure.

   **NOTE:**
   Refer to the inside back cover of this manual for lubrication specifications.

14. Replace plug (A) and torque to 30 Nm (22 lbf-ft).

**CAUTION**

Before starting the machine, check to be sure all bystanders have cleared the area.

15. Start the engine and raise the header fully.

16. Shut down the engine, and remove the key from the ignition. Engage the windrower lift cylinder safety props.

17. Remove the block from under the header.

18. Disengage the windrower lift cylinder safety props.

**CAUTION**

Before starting the machine, check to be sure all bystanders have cleared the area.

19. Start the engine and lower the header to a level position on the ground.

20. Shut down the engine, and remove the key from the ignition.

21. Recheck the oil level.

22. Check gasket (B) for breaks or cracks, and replace if necessary.

23. Install plug (A) and gasket (B). Tighten securely.

Draining the Cutterbar

⚠️ DANGER
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

⚠️ WARNING
Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Start the engine, and raise the disc header.
2. Place block under each end of the disc header as shown, so the right end is lower than the left end.

**IMPORTANT:**
Always drain lubricant from the right end of the disc header. Draining lubricant from the left end of the disc header may lead to breather contamination or failure.

3. Tilt the header fully forward, and lower disc header onto the blocks.
4. Shut down the engine, and remove the key from the ignition.
5. Place a 10 liter (10.5 US qts) capacity container under the right end of the cutterbar, clean area around plug (A), and remove the plug.

**IMPORTANT:**
Do NOT remove hex head bolts (B) securing cutterbar end plate to cutterbar or lubricant leaks could result.

6. Allow sufficient time for lubricant to drain, then reinstall cutterbar plug (A).

**NOTE:**
Do NOT flush the cutterbar.
7. Fill the cutterbar with lubricant before operating the disc header. For instructions, refer to *Filling Cutterbar with Lubricant, page 87*.

**IMPORTANT:**
Dispose of used lubricant responsibly.

*Filling Cutterbar with Lubricant*

This procedure should be used when the cutterbar has been completely drained of oil. If you are checking oil level or topping it up, refer to *Checking and Adding Lubricant in Cutterbar, page 83*.

⚠️ **DANGER**
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

⚠️ **WARNING**
Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

⚠️ **WARNING**
Check to be sure all bystanders have cleared the area.

**IMPORTANT:**
The cutterbar should be completely empty of oil before filling it. For instructions, refer to *Draining the Cutterbar, page 86*.

1. Start the engine, and raise the header fully.

2. Place a block under each end of the disc header, so the right end is higher than the left end.

3. Lower the header onto the blocks.

4. Shut down the engine, and remove the key from the ignition.

5. Remove access plug (A) from the raised end of the cutterbar and add the **EXACT** amount of lubricant specified. Refer to the inside back cover of this manual for a list of recommended fluids, lubricants, and quantities for the machine.

**IMPORTANT:**
Do **NOT** overfill the cutterbar. Overfilling can cause overheating, damage, or failure of cutterbar components.

**NOTE:**
Do **NOT** remove hex bolts (B) securing the cutterbar end plate to the rest of the cutterbar, or lubricant leaks could result.

6. Install access plug (A). Torque to 30 Nm (22 lbf-ft).

7. Start the engine, and raise the header fully.

8. Shut down the engine, and remove the key from the ignition. Engage the windrower lift cylinder safety props. For instructions, refer to *3.2.1 Engaging and Disengaging Header Safety Props – M1240 Windrower, page 20*.
9. Remove the blocks from under the cutterbar.

10. Lower the header.

11. Shut down the engine, and remove the key from the ignition. Disengage the windrower lift cylinder safety props. For instructions, refer to 3.2.1 Engaging and Disengaging Header Safety Props – M1240 Windrower, page 20.

12. Check the lubricant level. For instructions, refer to Checking and Adding Lubricant in Cutterbar, page 83.

### 4.6.2 Cutterbar Discs

Figure 4.20: Interchangeable Cutterbar Discs

Cutterbar discs (A) are interchangeable and can be moved to a spindle that rotates in the opposite direction as long as the disc is in usable condition and the blades are oriented to cut in the correct direction.

Perform daily inspections to ensure that cutterbar discs have not suffered damage from rocks, or experienced excessive wear from abrasive working conditions.

The cutterbar discs are **NOT** repairable and must be replaced if severely damaged or worn.

**IMPORTANT:**

If holes appear in a cutterbar disc, replace the disc immediately. Do **NOT** attempt to repair the cutterbar discs. Always use factory replacement parts.
Inspecting Cutterbar Discs

**WARNING**
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

**CAUTION**
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

**CAUTION**
Damaged blades may damage the cutterbar and result in poor cutting performance. Replace damaged blades immediately.

**IMPORTANT:**
Unbalanced cutterbar components can lead to premature cutterbar failure.

1. Inspect the cutterbar disc surface (D) for cracks, excessive wear, and disc distortion. Replace any damaged or worn discs as required.

   **NOTE:**
   Any damaged or worn cutterbar discs are **NOT** repairable and must be replaced if damaged.

2. Inspect the cutterbar disc edges (E) for cracks, excessive wear, and edge distortion. Replace any damaged or worn discs as required.

   **NOTE:**
   Any damaged or worn cutterbar discs are **NOT** repairable and must be replaced if damaged.

3. Ensure that disc blade fasteners (A) are securely attached to the cutterbar disc and that nut shields (B) are present and undamaged. Replace as required.

4. Check that cutterbar disc bolts (C) are securely attached to the spindles. Tighten as required.

5. Inspect the cutterbar disc for severe deformation. If the disc is deformed, dimension (A) must **NOT** exceed 48 mm (1 7/8 in.). Replace as required.
6. Inspect the cutterbar disc for abrasion (A). The wear limit for abrasion is reached when the material thickness of the cutterbar discs is less than 3 mm (1/8 in.). Replace as required.

**Removing Cutterbar Discs**

⚠️ **WARNING**
To avoid injury or death from unexpected start-up of machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

⚠️ **CAUTION**
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.
1. Raise the header.
2. Shut off the engine, and remove the key from the ignition.
5. Place a pin (or equivalent) in the front hole of rock guard (B) to prevent disc rotation while loosening bolts.

6. Remove four M12 bolts (A) and washers.

7. Remove cutterbar disc cap (A).

8. Remove cutterbar disc (B).

9. To remove the outboard cutterbar discs, refer to Removing Left Driven Drum and Driveline, page 126 and Removing Right Driven Drum and Driveline, page 132.
Installing Cutterbar Discs

WARNING

To avoid injury or death from unexpected start-up of machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

WARNING

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Place a pin (or equivalent) in the front hole of rock guard (D) to prevent disc rotation while tightening bolts.

2. Position new disc (A) on the spindle, ensuring that it is positioned at a 90° angle in relation to the adjacent discs.

3. Install cutterbar disc cap (B), and secure assembly with four M12 bolts and washers (C). Torque bolts to 85 Nm (63 lbf·ft).

WARNING

Ensure the cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

4. Remove pin (or equivalent) from the front hole of the rock guard.

5. Close the cutterbar curtain. For instructions, refer to 3.6.2 Closing Cutterbar Curtain, page 46.

6. To install the outboard cutterbar discs, refer to Installing Left Driven Drum and Driveline, page 129 and Installing Right Driven Drum and Driveline, page 135.
4.6.3 Cutterbar Spindles

To prevent damage to the cutterbar and drive systems, each disc is attached to a spindle containing a shear pin (A).

If the disc contacts a large object such as a stone or stump, the pin will shear and the disc will stop rotating and move upwards while remaining attached to the spindle with a snap ring (B).

**NOTE:**

Once the spindle has risen due to shear pin failure, the spindle’s bearing will become unloaded. **DO NOT** replace the spindle due to excessive play. Check play after torquing spindle nut and replacing damaged shear pins.

Refer to **4.6.8 Cutterbar Spindle Shear Pin, page 138** to replace shear pin.

**IMPORTANT:**

- Spindles that rotate clockwise have right-leading threading and are identified by a smooth top on the spindle gear shaft (A).
- Spindles that rotate counterclockwise have left-leading threading and are identified by machined grooves on the spindle gear shaft (B) and nut (C).
- If the spindle’s position in cutterbar has changed, the rotational direction of that spindle **MUST** remain the same (that is, a clockwise spindle must maintain its clockwise rotation).
- Failure to maintain the rotation pattern can result in damage to the spindle and/or cutterbar components.
- Safecut components (shear pin) will not work if spindles are used in the wrong orientation.
Removing Cutterbar Spindles

⚠️ **DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ **CAUTION**

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Park on a flat, level surface.
2. Raise the header.
3. Shut off the engine, and remove the key from the ignition.
5. Open cutterbar curtain (A). For instructions, refer to 3.6.1 Opening Cutterbar Curtain, page 45.

6. Place a pin (or equivalent) in the front hole of the rock guard (B) to prevent disc rotation while loosening bolts.
7. Remove four M12 bolts (A) and washers.
8. Remove cutterbar disc cap (A).

9. Remove cutterbar disc (B).

**IMPORTANT:**
Blades are rotation specific. Switch the entire disc when swapping spindles.

10. Remove spacer plate (A).

**NOTE:**
The area around the spindle must be cleaned thoroughly to prevent debris from entering into the cutterbar gearbox.

11. Rotate spindle hub (A) to access nuts (B), and remove eleven M12 lock nuts (B) and washers.
12. Remove spindle (A) from the cutterbar.

### Installing Cutterbar Spindles

**Figure 4.37: Underside of Cutterbar Spindles**

**NOTE:**
Right discs (A) and left discs (B) are slightly offset as shown, depending on which idler gear the spindle is turning.

- Spindles that rotate clockwise have left-leading threading
- Spindles that rotate counterclockwise have right-leading threading
IMPORTANT:
Right discs (A) and left discs (B) are timed and must be at a 90° angle from adjacent discs when reinstalled. Misaligned discs could result in the following:

- Disc blades of co-rotating discs hitting each other
- Disc blades of diverging discs hitting adjacent discs

Check the clearance (timing) using disc timing tool (MD #307954) as shown in Figure 4.38, page 97 before tightening the spindle to the cutterbar. The disc is correctly timed if the spindle hub is aligned with the disc timing tool as shown. Turn the disc by hand to ensure the disc blades do NOT contact each other or adjacent discs. If contact occurs or the alignment is incorrect, lift the spindle clear of the mounting bolts, rotate the spindle 180° (ensuring that the base does not turn), and reinstall. Recheck the timing before bolting the hub down and tightening all of the nuts.

Figure 4.38: Checking Timing with Disc Timing Tool – View from Above

NOTE:
Spindles do NOT need to be bolted to the disc timing tool; visual confirmation of alignment will suffice. A disc timing tool (MD #307954) is provided with the header and is located on the panel on the right side of the header. For storage location of disc timing tool on header, refer to Figure 4.156, page 148.

⚠️ DANGER
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ CAUTION
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.
MAINTENANCE AND SERVICING

1. Park on a flat, level surface.

2. Lower the disc header fully, shut off the engine, and remove the key.

   **NOTE:**
   To prevent oil from spilling from the cutterbar while installing disc spindles, ensure the disc header is on a flat, level surface, and is tilted all the way back.

3. Determine the suitable spindle rotation pattern for the crop conditions. For instructions, refer to 4.6.3 Cutterbar Spindles, page 93.

4. Ensure that spindle O-ring (A) is properly seated, cleaned, and undamaged.

5. Insert spindle (A) into the cutterbar.

![Figure 4.39: Left Spindle O-ring](image1)

![Figure 4.40: Left Spindle](image2)
6. Insert studs (A) into the spindle as shown.

**NOTE:**
Plugs are factory-installed as shown in position (B), but may come loose over time. Ensure the studs are inserted into the proper locations.

**IMPORTANT:**
Ensure clockwise spindles rotate clockwise and counterclockwise spindles (with machined grooves) rotate counterclockwise.

**IMPORTANT:**
The offset gear design makes it possible to install spindles that rotate in the wrong direction. If the spindles rotate in the wrong direction, the discs will not spin up after impact, potentially damaging cutterbar components.

7. Check and adjust disc timing as follows:

**NOTE:**
There are an odd number of teeth on the cutterbar gears which can make spindle hub alignment difficult.

a. Place one end of disc timing tool (A) on adjacent disc (B) and the other end on left spindle as shown.

b. Check bolt hole alignment (C) as shown.

c. If alignment is slightly off, lift spindle and rotate it one tooth in either direction to try and line up bolt holes.

d. Recheck with disc timing tool, if still not lining up, lift spindle and rotate hub 1/4 turn at a time, and recheck again with disc timing tool.

e. Repeat until bolts are aligned.

**NOTE:**
Arrow points to the front of disc header.

8. Ensure that hub (A) is fully seated into the cutterbar before tightening nuts (B).

9. Rotate spindle hub (A) to access the studs, and install eleven M12 lock nuts (B) and washers.
10. Torque bolts to 50 Nm (37 lbf-ft) following the tightening pattern shown at right.

**NOTE:**
Hub is removed from the illustration for clarity.

**IMPORTANT:**
Do **NOT** use an impact wrench when tightening as it will damage the weld studs.

11. Install spacer plate (A).

12. Place a pin (or equivalent) in front hole (D) of rock guard to prevent disc rotation while tightening bolts.

**IMPORTANT:**
Blades are rotation specific. Switch the entire disc when swapping spindles.

13. Position disc (A) on the spindle ensuring that it is positioned at a 90° angle in relation to the adjacent discs.

**NOTE:**
Turn disc (A) by hand to ensure its disc blades do not contact each other or adjacent discs.

14. Install cutterbar disc cap (B) and secure the assembly with four M12 bolts and washers (C). Torque the bolts to 85 Nm (63 lbf-ft).

**WARNING**
Ensure the cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

15. Remove the pin (or equivalent) from the front hole of the rock guard.

4.6.4 Disc Blades

Each disc has two blades (A) attached at opposite ends that are free to rotate horizontally on a specially designed shoulder bolt. Blade (A) has two cutting edges and can be flipped over so that the blade does not need replacing as often.

The blades are NOT repairable and must be replaced if severely worn or damaged.

IMPORTANT:
Always use factory replacement parts.

NOTE:
Discs are equipped with 18° bevel-down blades. For service parts, refer to the header parts catalog.
Inspecting Disc Blades

**WARNING**
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

**CAUTION**
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

**CAUTION**
Damaged or loose disc blades or blade attachment hardware can be ejected during machine operation and may cause personal injury or machine damage.

**IMPORTANT:**
Damaged blades may damage the cutterbar and result in poor cutting performance. Replace damaged blades immediately.

1. Check daily that the disc blades are securely attached to the disc.
2. Inspect blades for cracks, blade wear (A), and/or elongated hole (B) beyond safe operating limits (C).
3. Replace blades immediately when problems are noticed.

**IMPORTANT:**
Blades should be replaced in pairs or the disc may become unbalanced and damage the cutterbar.

![Figure 4.49: Disc Blades](image)

- A - Blade Wear to Center Line
- B - Elongated Hole
- C - Maximum Elongation 21 mm (13/16 in.)

**IMPORTANT:**
The disc blades have cutting edges on both sides so the blades can be turned over and reused. The twist in each blade determines the cutting direction. If you are unsure which direction the spindles rotate, refer to: **4.6.9 Reconfiguring Cutterbar Crop Stream, page 146** for instructions.

![Figure 4.50: Counterclockwise Disc Rotation](image)
Inspecting Disc Blade Hardware

⚠️ CAUTION

Damaged or loose disc blades or blade attachment hardware can be ejected during machine operation and may cause personal injury or machine damage.

Inspect the blade attachment hardware each time the blades are changed. Refer to *Removing Disc Blades, page 105* and *Installing Disc Blades, page 107* for the hardware replacement procedure.
1. Check and replace the bolt if:
   - Bolt has been removed and installed five times
   - Head (A) is worn flush with the bearing surface of the blade
   - Diameter of the bolt neck is worn (B) 3 mm (1/8 in.)
   - Bolt is cracked (C)
   - Bolt is visibly distorted (D)
   - Bolt shows evidence of interference (E) with adjacent parts

   **NOTE:**
   This can occur when disc speed is set too low in cane-type crops.
2. Check and replace nuts under the following conditions:
   - Nut has been previously installed—nuts are one-time use only
   - Nut shows signs of wear (A) that is more than half the original height (B)
   - Nut is cracked

Removing Disc Blades

⚠️ DANGER
To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ CAUTION
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.
1. Raise the rotary disc header fully,
2. Shut off the engine, and remove the key from the ignition.
5. Rotate disc (A) so blade (B) faces forward and lines up with hole (C) in rock guard.

6. Place a pin (or equivalent) in the front hole of the neighboring rock guard to prevent disc rotation while loosening blade bolts.

7. Clean debris from the blade attachment area.

8. Remove nut (A) and discard.

   **IMPORTANT:**
   Nuts are one-time-use only. When flipping or changing a blade, replace using a **NEW** nut only.

9. Remove shoulder bolt (B) and blade (C).
Installing Disc Blades

⚠️ WARNING
To avoid injury or death from unexpected start-up of machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

⚠️ CAUTION
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

IMPORTANT:
If you are unsure which direction the spindles rotate, refer to 4.6.9 Reconfiguring Cutterbar Crop Stream, page 146.

1. Place a pin (or equivalent) in the front hole of the rock guard to prevent disc rotation while tightening blade bolts.
2. Install a new or reversed blade (A) with shoulder bolt (B) onto disc (C).
   IMPORTANT:
   Nuts are one-time-use only. When flipping or changing a blade, replace using a NEW nut only.
3. Install new nut (D) and torque to 125 Nm (92 lbf·ft).
4. Remove pin (or equivalent) from the front hole of the rock guard.

⚠️ WARNING
Ensure the cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

4.6.5 Accelerators

Accelerators (A) are mounted on each outboard disc and are designed to quickly move cut material off the disc and into the conditioner. R216 SP headers have two pairs of accelerators on the two pairs of outboard discs.

Periodically inspect accelerators for damage and loose or missing fasteners, and replace as necessary.

**IMPORTANT:**
Always replace accelerators in pairs to ensure proper disc balance.

**NOTE:**
Illustration at right shows the left side of the header. The right side is opposite.

*Figure 4.59: Accelerators*

---

**Inspecting Accelerators**

⚠️ **CAUTION**
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

⚠️ **WARNING**
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Raise the header fully.
2. Shut down the engine, and remove the key from the ignition.
4. Open the cutterbar curtain (A). For instructions, refer to 3.6.1 Opening Cutterbar Curtain, page 45.

*Figure 4.60: Cutterbar Curtain*
5. Inspect accelerators (A) for damage and wear, and replace if worn to 50% or more of their original height or if they are no longer effectively moving crop.

6. Tighten or replace any loose or missing fasteners.

**Removing Accelerators**

⚠️ **WARNING**

To avoid injury or death from unexpected start-up of machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

⚠️ **CAUTION**

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

**IMPORTANT:**
Always replace accelerators in pairs to ensure proper disc balance.

1. Raise the header fully.

2. Shut off the engine, and remove the key from the ignition.

3. Engage the windrower lift cylinder safety props. For instructions, refer to [3.2.1 Engaging and Disengaging Header Safety Props – M1240 Windrower, page 20](#).

4. Open cutterbar curtain (A). For instructions, refer to [3.6.1 Opening Cutterbar Curtain, page 45](#).
MAINTENANCE AND SERVICING

5. Place a pin (or equivalent) in the front hole of the rock guard to prevent disc rotation while loosening bolts.

6. Line up the hole in the rock guard with the bolt to be removed.

7. Remove nut (A), flange bolt (B), and disc blade (C) from the disc. Discard the nut.

8. Remove lock nut (A), accelerator (B), blade holder (C), and hex-socket bolt (D).

9. Repeat the removal procedure for the second accelerator.

10. Remove the pin.
Installing Accelerators

⚠️ WARNING
To avoid injury or death from unexpected start-up of machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

⚠️ CAUTION
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

**IMPORTANT:**
Always replace accelerators in pairs to ensure proper disc balance.

1. Place a pin (or equivalent) in the front hole of the neighboring rock guard to prevent disc rotation while tightening blade bolts.

**IMPORTANT:**
Accelerators are unidirectional; both clockwise and counterclockwise accelerators are used on the cutterbar. Verify the direction of the disc before installing accelerators. If you are unsure which direction the spindle rotates, refer to 4.6.3 Cutterbar Spindles, page 93.

2. Install lock nut (A), accelerator (B), blade holder (C), and hex-socket bolt (D). Do **NOT** tighten at this time.

3. Install new nut (A), flange bolt (B), and disc blade (C) onto the disc.

![Figure 4.65: Accelerator Installation](image1)

![Figure 4.66: Accelerator Installation](image2)
4. Torque interior nut (A) to 58 Nm (43 lbf·ft).

5. Torque exterior nut (B) (closest to the blade) to 125 Nm (92 lbf·ft).

6. Repeat the installation procedure for the second accelerator.

**WARNING**

Ensure the cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

7. Remove the pin (or equivalent) installed in Step 1, page 111.

---

**4.6.6 Rock Guards**

The machine is equipped with rock guards at each cutting disc location. Rock guards prevent the cutterbar from digging into the ground and protect the disc from coming in contact with stones and other debris. Periodically inspect rock guards for damage and replace as necessary.

**Inspecting Rock Guards**

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

**WARNING**

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Raise the header fully.

2. Shut down the engine, and remove the key from the ignition.

MAINTENANCE AND SERVICING

4. Inspect rock guards for wear, cracks, damage, or distortion. Replace if worn to 75% or more of their original thickness.

5. Check for loose or missing fasteners; tighten or replace fasteners as needed.

Removing Rock Guards

1. Remove two hex head screws, washers, and lock nuts (A).

2. Slide rock guard (A) forward (in the direction of arrow [B]) and remove.
**Installing Rock Guards**

1. Guide the rock guard onto the cutterbar until tabs (A) sit on top of the cutterbar and the bottom back bolt holes line up.

2. Center the rock guard if there are gaps on either side, and install two hex head screws, washers, and lock nuts (A).

   **NOTE:**
   Lock nuts (A) and washers are installed on top.

3. Torque hardware to 68 Nm (50 lbf-ft).

---

**4.6.7 Drums**

Suspended and driven drums deliver cut material from the ends of the cutterbar and help maintain an even crop flow into the conditioner.

---

*Figure 4.72: Rock Guards*

*Figure 4.73: Rock Guards*

*Figure 4.74: Driven and Suspended Drums*

A - Suspended Drums  
B - Left Driven Drum  
C - Right Driven Drum
Inspecting Drums

Inspect drums daily for signs of damage or wear.

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ CAUTION

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Lower the header fully.

2. Shut off the engine, and remove the key from the ignition.

4. Inspect drums (A), (B), and (C) for damage and wear, and replace if the drums are worn at the center to 50% or more of their original thickness. Do NOT repair drums.

5. Examine the drums for large dents. Replace dented drums to prevent an imbalance in the cutterbar.

6. Tighten or replace loose or missing fasteners.
7. Inspect the left and right driven drums for severe deformation. If the drum is deformed, dimension (A) must **NOT** exceed 48 mm (1 7/8 in.). Replace as required.

![Figure 4.77: Driven Drum – Cutaway View](image1)

8. Inspect the left and right driven drums for abrasion (A). The wear limit for abrasion is reached when the material thickness of the drums is less than 3 mm (1/8 in.). Replace as required.

![Figure 4.78: Driven Drum – View from Above](image2)

**WARNING**

Ensure the cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

9. Close cutterbar curtain (A). For instructions, refer to **3.6.2 Closing Cutterbar Curtain, page 46**.

![Figure 4.79: Cutterbar Curtain](image3)
Removing Suspended Drums

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

**WARNING**

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

**NOTE:**

Illustrations show right suspended drum, left suspended drum is opposite.

1. Raise the header.

2. Shut down the engine, and remove the key from the ignition.

3. Engage the windrower lift cylinder safety props. For instructions, refer to [3.2.1 Engaging and Disengaging Header Safety Props – M1240 Windrower, page 20](#).

4. Open cutterbar curtain (A). For instructions, refer to [3.6.1 Opening Cutterbar Curtain, page 45](#).

5. Loosen two M10 hex flange head bolts (A). Remove driveline shield (B).

---

### Figure 4.80: Cutterbar Curtain

![Cutterbar Curtain Diagram](image1)

### Figure 4.81: Driveline Shield

![Driveline Shield Diagram](image2)
6. Remove four M12 hex flange head bolts (A) securing suspended drum (B) to shaft (C), and remove suspended drum (B).

7. Remove two M10 hex flange head bolts (A) and remove driveline shield (B).

8. Repeat Step 5, page 117 to Step 7, page 118 to remove the opposite suspended drum.
Installing Suspended Drums

DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

WARNING

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

NOTE:
Illustrations show the right suspended drum, the left suspended drum is opposite.

1. Position suspended drum (B) to shaft (C) as shown.

2. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around the threads of four M12 hex flange head bolts (A). Use the bolts to secure suspended drum to shaft, and torque to 100 Nm (74 lbf·ft).

3. Position driveline shield (B) as shown. Use two M10 hex flange head bolts (A) to secure driveline shield (B) in place.

4. Repeat Step 1, page 119 to Step 3, page 119 to install the opposite suspended drum.

![Figure 4.86: Cutterbar Curtain](image)

**Replacing Left Suspended Drum Drive Belt**

⚠️ **DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ **WARNING**

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Raise the header.
2. Shut down the engine, and remove the key from the ignition.

![Figure 4.87: Cutterbar Curtain](image)
Removing left suspended drive belt

5. On the left side of the header, remove two M10 hex flange bolts (A). Remove driveline shield (B).

6. Open left driveshield (A). For instructions, refer to 3.5.1 Opening Driveshields, page 42.

7. Loosen two bolts (A) at front.
8. Remove two bolts (B) and shield plate (C).
9. Remove four bolts (D) securing spindle spline to the gearbox hub.
NOTE:
Removing the four bolts dismounts spindle spline (A) from the gearbox hub.

10. Using a ratchet, remove belt tension by rotating tensioner (A) clockwise.
11. Remove belt (B) from the pulley, and slide the belt through opening (C).
12. Remove the ratchet to release the tensioner.

Installing left suspended drive belt
13. Slide belt (A) through opening (B).
14. Using a ratchet, rotate tensioner (E) clockwise.
15. Position belt (A) on gearbox hub (D) and pulley (C) as shown.
16. Remove the ratchet to release tensioner (E).

Figure 4.91: Left Driven Drum – Spindle Spline Dismounted
Figure 4.92: Left Drum Belts
Figure 4.93: Left Drum Belts
17. Hold spindle spline (A) up and secure on gear hub (B) with four bolts (C).

**NOTE:**
Frame panel made transparent to show connection between spindle spline (A) and gear hub (B).

18. Slide shield plate (A) forward, and tighten two bolts (B).
19. Install and tighten two more bolts (C).

20. Close left driveshield (A). For instructions, refer to **3.5.2 Closing Driveshields, page 44.**
21. Install driveline shield (B) using two bolts (A).

Replacing Right Suspended Drum Drive Belt

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ WARNING

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Raise the header.
2. Shut down the engine, and remove the key from the ignition.
Removing right suspended drive belt

4. Open right driveshield (A). For instructions, refer to 3.5.1 Opening Driveshields, page 42.

5. Using a ratchet, release belt tension by rotating counterclockwise on tensioner (A).

6. Remove belt (B) from the pulleys.

Installing right suspended drive belt

7. Using a ratchet, rotate tensioner (A) counterclockwise to move it away from the pulleys.

8. Slide belt (B) on pulleys as shown.

9. Remove ratchet from tensioner to release tensioner.
10. Close right driveshield (A). For instructions, refer to 3.5.2 Closing Driveshields, page 44.

Removing Left Driven Drum and Driveline

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ WARNING

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Raise the header.

2. Shut down the engine, and remove the key from the ignition.

5. Remove two M10 hex flange head bolts (A) and loosen two M10 hex flange head bolts (B). Remove driveline shield (C).

6. Remove two M10 hex flange head bolts (A) and remove driveline shield (B).

7. Remove eight M8 hex flange head bolts (A) and two drum shields (B).
8. Remove four M12 hex flange head bolts (A) securing driveline assembly (B) to hub drive (C).

9. Slide driveline (A) downwards, tilt it to the side, and pull the driveline up and out of the drum.

10. Use an 18 mm deep socket and an extension to remove four M12 bolts (A) and washers holding drum disc assembly (B) in place.

11. Remove drum disc assembly (B).
Installing Left Driven Drum and Driveline

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ WARNING

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Ensure spacer (A) is on the spindle.
2. Apply an anti-seize compound to spindle splines (B).
3. Position drum disc assembly (B) over the spindle ensuring disc is rotated 90° from the neighboring disc.
4. Using an 18 mm deep socket and an extension, secure the drum disc in place with four M12 bolts (A) and washers. Torque hardware to 85 Nm (63 lbf·ft).
MAINTENANCE AND SERVICING

5. Insert driveline (B) at an angle and guide it past hub drive (C) and drum (D).

6. Insert splined spindle end (A) into the splined bore of driveline (B).

7. Place a bead of high-strength threadlocker (Loctite® 262 or equivalent) around the threads of four M12 hex flange head bolts (A). Use the bolts to secure driveline assembly (B) to hub drive (C). Torque bolts to 100 Nm (74 lbf·ft).

8. Position driveline shield (B) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around the threads of two M10 hex flange head bolts (A). Use bolts (A) to secure driveline shield (B) in place.
9. Position two drum shields (B) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around the threads of eight M8 hex flange head bolts (A). Use the bolts to secure the drum shields in place. Torque hardware to 27 Nm (20 lbf·ft).

10. Position driveline shield (C) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around the threads of two M10 hex flange head bolts (A) and two M10 hex flange head bolts (B). Use bolts (A) and (B) to secure driveline shield (C) in place.

11. Tighten all hardware on driveline shields.

**WARNING**

Ensure the cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

Removing Right Driven Drum and Driveline

**DANGER**

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

**WARNING**

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Raise the header.
2. Shut down the engine, and remove the key from the ignition.
5. Remove two M10 hex flange head bolts (A) and loosen two M10 hex flange head bolts (B). Remove driveline shield (C).
6. Remove eight M8 hex flange head bolts (A) and two drum shields (B).

7. Remove two M10 hex flange head bolts (A) and remove driveline shield (B).

8. Remove four M10 hex flange head bolts (A) securing driveline assembly (B) to hub drive (C).
9. Slide driveline (A) downwards, tilt it to the side, and pull the driveline up and out of the drum.

10. Use an 18 mm deep socket and an extension to remove four M12 bolts (A) and washers holding drum disc assembly (B) in place.

11. Remove drum disc assembly (B).
Installing Right Driven Drum and Driveline

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ WARNING

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Ensure spacer (A) is on the spindle.
2. Apply an anti-seize compound to spindle splines (B).
3. Position drum disc assembly (B) 90° from neighboring disc.
4. Use an 18 mm deep socket and an extension to install four M12 bolts (A) and washers that hold the drum disc in place. Torque hardware to 85 Nm (63 lbf·ft).

Figure 4.125: Right Driven Spindle

Figure 4.126: Right Driven Drum – View from Above
5. Insert driveline (B) at an angle and guide it past hub drive (C) and drum (D).

6. Insert splined spindle end (A) into the splined bore of driveline (B).

7. Place a bead of high-strength threadlocker (Loctite® 262 or equivalent) around the threads of four M10 hex flange head bolts (A). Use the bolts to secure driveline assembly (B) to hub drive (C). Torque the bolts to 57.5 Nm (42 lbf·ft).

8. Position driveline shield (B) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around the threads of two M10 hex flange head bolts (A). Use M10 hex flange head bolts (A) to secure driveline shield (B) in place.
9. Position two drum shields (B) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around the threads of eight M8 hex flange head bolts (A). Use the bolts to secure the drum shields in place. Torque hardware to 27 Nm (20 lbf·ft).

10. Position driveline shield (C) as shown. Apply a bead of medium-strength threadlocker (Loctite® 243 or equivalent) around the threads of two M10 hex flange head bolts (A) and two M10 hex flange head bolts (B). Use bolts (A) and (B) to secure driveline shield (C) in place.

11. Tighten all hardware on driveline shields.

**WARNING**

Ensure the cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.

4.6.8 Cutterbar Spindle Shear Pin

To prevent damage to the cutterbar and drive systems, each disc is attached to a spindle containing shear pin (A).

If the disc contacts a large object such as a stone or stump, the pin will shear and the disc will stop rotating and move upwards while remaining attached to the spindle with snap ring (B).

**IMPORTANT:**
Ensure correct orientation of the shear pins during replacement:
- Spindles that rotate clockwise have right-leading threading.
- Spindles that rotate counterclockwise have left-leading threading.

**NOTE:**
Once a spindle has risen due to shear pin failure, the spindle’s bearing will become unloaded. Do NOT replace the spindle due to excessive play. Check play after torquing spindle nut and replacing damaged shear pins.

**NOTE:**
A special spindle-nut wrench (A) is located under the panel on the right side of the header. This tool is used to loosen and tighten the spindle nuts.
Removing Cutterbar Spindle Shear Pin

**WARNING**
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

**CAUTION**
Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Raise the header fully.
2. Shut off the engine, and remove the key from the ignition.
5. Clean any debris from the work area.

6. Refer to the applicable disc removal procedure for the type of disc with a broken shear pin:
   - To remove cutterbar disc (A), refer to Removing Cutterbar Discs, page 90.
   - To remove left driven drum (B), refer to Removing Left Driven Drum and Driveline, page 126.
   - To remove right driven drum (C), refer to Removing Right Driven Drum and Driveline, page 132.
7. Remove spacer plate (A) and retaining ring (B).

8. Remove the M12 bolt and remove safecut spindle-nut wrench (A) from its storage location.
IMPORTANT:

- Spindles that rotate clockwise have right-leading threading and a smooth top on spindle gear shaft (A).
- Spindles that rotate counterclockwise have left-leading threading and machined grooves on spindle gear shaft (B) and nut (C).
- If a spindle’s position in the cutterbar has changed, the rotational direction of that spindle **MUST** remain the same (that is, a clockwise spindle must maintain its clockwise rotation).
- Failure to maintain a proper rotation pattern can result in damage to the spindle and/or cutterbar components.

9. Remove two M10 bolts and washers (A).

10. Inspect the threads of two M10 bolts (A), and replace bolts if damaged.

11. Use the safecut spindle-nut wrench to remove nut (A).

12. Remove hub (B). Inspect hub for damage, and replace if necessary.
13. Remove damaged shear pins (A) using pin punch (B).

Installing Cutterbar Spindle Shear Pin

⚠️ WARNING

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

⚠️ CAUTION

Disc blades have two sharp cutting edges that can cause serious injury. Exercise caution and wear gloves when working with blades.

1. Fill the space above the bearing with grease. Refer to the inside back cover of this manual for a list of recommended fluids, lubricants, and capacities for the machine.

2. Reinstall Belleville washer (A) with its dome down and outside edges up.

3. Place hub (A) on spindle (B), and line up the slots in the hub with the holes in the spindle shaft.

4. Position new shear pins with grooves (C) as shown.

IMPORTANT:
The correct shear pin orientation is critical. Both shear pin grooves (C) must be facing the same direction and be parallel to the cutterbar.
5. Install new shear pin (A) with a pin punch and hammer. Repeat on the other side of spindle.

**NOTE:**
Ensure that the ends of the shear pins do **NOT** protrude past the step in the hub.

6. Install nut (A) and spacer plate (B).

7. Attach safecut spindle-nut wrench (B) 90° (D) to the torque wrench (A).

**IMPORTANT:**
If the wrench is not attached correctly, the proper torque will **NOT** be applied to the nut.

8. Position safecut spindle-nut wrench (B) on spindle nut (C). Torque nut to 300 Nm (221 lbf·ft).
9. Install two M10 bolts (A) and washers. Torque hardware to 55 Nm (40 lbf·ft).

10. Install retaining ring (A).

11. Depending on the type of disc with the new shear pin, refer to the applicable disc installation procedure:

   - Install cutterbar disc (A). For instructions, refer to Installing Cutterbar Discs, page 92.
   - Install left driven drum (B). For instructions, refer to Installing Left Driven Drum and Driveline, page 129.
   - Install right driven drum (C). For instructions, refer to Installing Right Driven Drum and Driveline, page 135.

**WARNING**

Ensure the cutterbar is completely clear of foreign objects. Foreign objects can be ejected with considerable force when the machine is started and may result in serious injury or machine damage.
12. Close cutterbar curtain (A). For instructions, refer to **3.6.2 Closing Cutterbar Curtain, page 46**.

13. Return safecut spindle-nut wrench to its storage location. For storage location of wrench (B), refer to Figure **4.156, page 148**.

### 4.6.9 Reconfiguring Cutterbar Crop Stream

Discs are factory-installed to produce four crop streams, but the disc rotation pattern can be changed by swapping discs (and their corresponding spindles) to suit crop conditions. Each spindle and disc pair is designed to rotate in one direction and must be changed as sets when altering crop flows.

Reducing or increasing the number of crop streams will produce the following results:

- Reducing the number of crop streams will result in narrower windrows.
- Increasing the number of crop streams will result in smoother, wider windrows.

**NOTE:**
Increasing the number of crop streams will also increase the number of diverging disc pairs which may negatively affect cut quality in certain conditions.
IMPORTANT:

- Spindles that rotate clockwise have right-leading threading and are identified by a smooth top on the spindle gear shaft (A).
- Spindles that rotate counterclockwise have left-leading threading and are identified by machined grooves on the spindle gear shaft (B) and nut (C).
- If the spindle’s position in cutterbar has changed, the rotational direction of that spindle MUST remain the same (that is, a clockwise spindle must maintain its clockwise rotation).
- Failure to maintain the rotation pattern can result in damage to the spindle and/or cutterbar components.
- Safecut components (shear pin) will not work if spindles are used in the wrong orientation.

Changing R216 SP Cutterbar Crop Stream Configuration

Figure 4.155: R216 SP (10 Disc) Spindle Rotation Pattern and Crop Streams

NOTE:
For instructions, refer to Removing Cutterbar Spindles, page 94 and Installing Cutterbar Spindles, page 96.

To change R216 SP (10 disc) spindle rotation from four crop streams (A) to two crop streams (B):

- Swap disc/spindle (3) with disc/spindle (8).

NOTE:
Switching from 4 streams to 2 streams is a recommended setting when cutting light alfalfa and using the double windrower attachment (DWA).
MAINTENANCE AND SERVICING

Figure 4.156: Disc Timing Tool Location on Header

A - Disc Timing Tool (MD #307954)  B - Safecut Spindle-Nut Wrench (MD #246314)

NOTE:
A disc timing tool (A) (MD #307954) is provided with the header and is located on the panel on the right side of the header. For instructions on using the disc timing tool, refer to *Installing Cutterbar Spindles, page 96.*
4.7 Conditioner Roll Timing Gearbox

Conditioner roll timing gearbox is located inside the drive compartment at the right of the header and transfers power from the gearbox-driven lower roll to the upper roll.

Gearbox (A) does not require routine maintenance or service other than checking and changing oil.

4.7.1 Checking and Changing Conditioner Roll Timing Gearbox Oil

Change the oil after the first 50 hours of operation. Perform subsequent oil changes every 250 hours or annually (preferably before the start of the cutting season). Refer to this manual’s inside back cover for a list of recommended fluids, lubricants, and capacities.

⚠️ WARNING

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

IMPORTANT:

Check the gearbox oil level when the oil is warm. If the oil is cold, idle the machine for approximately 10 minutes prior to checking.

1. Lower the rotary disc header to the ground and adjust the header angle (tilt) so that the cutterbar is level (parallel) with the ground.
2. Shut down the engine, and remove the key from the ignition.
3. On the right side of the header, engage lift release latch (A) and pull handle (B) to open outboard driveshield (C).
4. Lift at handle (D) and open inboard driveshield (E).
5. Remove right driveshield (A). For instructions, refer to 4.11.1 Removing Driveshields, page 165.

Checking conditioner roll timing gearbox oil level:

6. Clean around oil level sight glass (A) and breather (B) on the inboard side of the gearbox.

7. Ensure that the lubricant is level with the top of the sight glass. If necessary, add lubricant through breather (B). Refer to this manual’s inside back cover for a list of recommended fluids, lubricants, and capacities.
Changing conditioner roll timing gearbox oil:

**WARNING**
To avoid bodily injury or death from unexpected start-up or fall of raised machine: stop engine, remove key, and engage lift cylinder lock-out valves before going under machine.

8. Raise the header to provide sufficient access to oil drain plug (A).

9. Shut down the engine, and remove the key from the ignition.

11. Clean around oil drain plug (A) on the bottom of the gearbox and around oil level plug (B) on the inboard side of the gearbox.

12. Place a 1 liter (1.05 qts [US]) container underneath the conditioner gearbox.

13. Remove oil drain plug (A) using a hex key.

14. Allow sufficient time for the oil to drain, reinstall oil drain plug (A), and tighten.

15. Fill with the specified volume of oil as listed on the inside back cover of this manual or until level is visible in sight glass (B).

16. Reinstall driveshields. For instructions, refer to 4.11.2 Installing Driveshields, page 166.

17. Lower the header fully.

18. Properly dispose of oil.
4.8 Header Drive Gearbox

Header drive gearbox (A) transfers power from the hydraulic motor to the cutterbar and conditioner. It is located inside the drive compartment at the left end of the header.

The only regular servicing required is maintaining the lubricant level and changing the lubricant according to the intervals specified in this manual. Refer to 4.4 Maintenance Requirements, page 76.

4.8.1 Checking Oil in Header Drive Gearbox

Change oil after the first 50 hours of operation. Perform subsequent oil changes every 250 hours or annually (preferably before the start of the cutting season).

IMPORTANT:
Check the gearbox oil level when the oil is warm. If the oil is cold, idle the machine for approximately 10 minutes prior to checking.

WARNING
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Park the windrower on a level surface.
2. Start the engine.
3. Adjust the header height until the cutterbar is parallel with the ground.
4. Shut down the engine, and remove the key from the ignition.
5. Open the left driveshield. For instructions, refer to 3.5.1 Opening Driveshields, page 42.
6. Locate gearbox (A) on the left side of the header.

7. Clean the area around check plug (A).

8. Remove check plug (A) with an 13 mm (1/2 in.) socket.

9. Ensure the lubricant is even with the bottom of the check hole (with check plug [A] removed) or slightly runs out of the check hole.

10. If necessary, remove fill plug (B) and add lubricant to the gearbox through the fill hole until lubricant runs out of the check hole (with check plug [A] removed). Refer to the inside back cover of this manual for a list of recommended fluids, lubricants, and capacities for the machine.

11. Reinstall the plug(s) and torque to 23 Nm (17 lbf-ft).

12. Close the left driveshield.

13. Lower the header fully.

14. Shut down the engine, and remove the key from the ignition.
4.8.2 Changing Oil in Header Drive Gearbox

Change oil after the first 50 hours of operation. Perform subsequent oil changes every 250 hours or annually (preferably before the start of the cutting season).

**WARNING**

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Clean around oil drain plug (A) on the bottom of the gearbox and around check plug (B) on the inboard side of the gearbox.
2. Place a 4 liter (1 gal. [US]) container under drain (A).
3. Remove oil drain plug (A).
4. Allow sufficient time for oil to drain, reinstall oil drain plug (A), and tighten.
5. Remove check plug (B) and fill plug (C).
6. Add lubricant through the fill hole (with fill plug [C] removed) until the oil level is even with the check hole (with check plug [B] removed). Refer to the inside back cover of this book for a list of recommended fluids, lubricants, and capacities for the machine.
7. Replace check plug (B) and fill plug (C). Tighten plugs.
8. Clean up any spilled oil and properly dispose of used oil and wipes.
9. Close the cutterbar curtain. For instructions, refer to 3.6.2 Closing Cutterbar Curtain, page 46.

Figure 4.165: Header Drive Gearbox
4.9 Cutterbar Curtain

Rubber curtain (A) is installed at the front of the header. The curtain forms a barrier that minimizes the risk of thrown objects being ejected from the cutterbar area. Always keep curtains down during operation.

Replace the curtains if they become worn or damaged.

4.9.1 Inspecting Cutterbar Curtain

The cutterbar curtain is an important safety feature that reduces the potential for thrown objects. Always keep the curtain down when operating the header.

⚠️ WARNING

To reduce the risk of personal injury and machine damage, do NOT operate the machine without curtain installed and in good condition. Foreign objects can be ejected with considerable force when the machine is started.

⚠️ CAUTION

To avoid injury, keep hands and fingers away from corners of doors when closing.

Check cutterbar curtain (A) for the following conditions:

- Rips and tears: Replace curtain.
- Cracking: While the curtain may look whole, this is an indicator that failure is imminent—replace curtain.
- Missing bolts: Replace missing hardware before operating.
4.9.2 Removing Cutterbar Curtain

2. Remove hex flange head bolt and washer (A) securing curtain (B) to the inboard side of the end panel.

   **NOTE:**
   Cutterbar removed from illustration for clarity.

3. Loosen six lock nuts (C) securing curtain (B) to the front of the header frame. Do **NOT** remove nuts at this time.

   **NOTE:**
   Curtain seam is on the inside.

4. Remove bumper (A) by sliding it off of bumper mount (D).

   **NOTE:**
   Top shield removed from illustration for clarity.

5. Remove six M10 bolts (B), six lock nuts (C), and bumper mount (D).

6. Repeat Steps 2, page 156 to 5, page 156 at the opposite end of the header.

7. Remove curtain (E).
4.9.3 Installing Cutterbar Curtain

1. Position curtain (E) on the front of the header frame.
   
   **NOTE:**
   Top shield removed from illustration for clarity.

2. Secure curtain with bumper mount (D), six M10 bolts (B), and six lock nuts (C). Do **NOT** tighten nuts at this time.

3. Slide bumper (A) onto bumper mount (D) from outboard end.

4. Tighten six lock nuts (C) securing curtain (B) to the front of the header frame.
   
   **NOTE:**
   Cutterbar removed from illustration for clarity.

5. Secure the curtain to the inboard side of the end panel with a hex flange head bolt and washer (A). Torque bolt to 29 Nm (21 lbf·ft).

6. Repeat Steps 1, page 157 to 5, page 157 at the opposite end of the header.

7. Disengage safety props and lower header. For instructions, refer to **3.2.1 Engaging and Disengaging Header Safety Props – M1240 Windrower, page 20.**
4.10 Conditioner

Rolls condition the crop by crimping and crushing the stem in several places, which allows the release of moisture resulting in faster drying times. There are two roll conditioner options—steel conditioner rolls and polyurethane rolls.

4.10.1 Inspecting Conditioner

Inspect conditioner roll bearings, feed roll bearings, and driveline U-joints for signs of wear or damage.

⚠️ DANGER

To avoid bodily injury or death from unexpected start-up or fall of a raised machine, stop engine, remove key, and engage windrower lift cylinder safety props before going under machine for any reason.

⚠️ WARNING

Exercise caution when working around the blades. Blades are sharp and can cause serious injury. Wear gloves when handling blades.

1. Lower the header fully.
2. Shut down the engine, and remove the key from the ignition.
3. Open driveshields (A). For instructions, refer to 3.5.1 Opening Driveshields, page 42.

4. Inspect feed roll left bearing (A) for signs of wear or damage. If the bearing needs replacing, contact your Dealer.
5. Inspect feed roll right bearing (A) for signs of wear or damage. If the bearing needs replacing, contact your Dealer.

6. Inspect conditioner roll left bearings (A) for signs of wear or damage. If the bearings need replacing, contact your Dealer.

**NOTE:**
Bearings are located on the inboard side of the feed roll tensioner assembly driver pulley and left roll arm.

7. Inspect conditioner driveline U-joints (B) for signs of wear or damage. If the U-joints need replacing, contact your Dealer.

8. Inspect conditioner drive U-joints (A) for signs of wear or damage. If the U-joints need replacing, contact your Dealer.

9. Inspect conditioner roll right bearings (B) for signs of wear or damage. If the bearings need replacing, contact your Dealer.
10. Inspect roll timing gearbox bearings (A) for signs of wear or damage. If the bearings need replacing, contact your Dealer.

**Conditioner Drive Belt**

The conditioner drive belt is located inside the left driveshield and is tensioned with a spring tensioner.

**Inspecting Conditioner Drive Belt**

Check the belt tension after the first 25 hours, and then check and inspect for damage or wear every 100 hours.

**WARNING**

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the rotary disc header fully.
2. Shut down the engine, and remove the key from the ignition.
3. Open left driveshield (A). For instructions, refer to 3.5.1 *Opening Driveshields, page 42.*
4. Inspect drive belt (A) and replace if damaged or cracked.
5. Check that jam nut (B) and adjuster nut (C) are tight.

6. Measure the length of belt tensioner spring (A) and ensure spring length (B) is 17 mm (11/16 in.) in accordance with spring tension decal (C). If the spring length requires adjustment, refer to Installing Conditioner Drive Belt, page 163.

7. Close the driveshield. For instructions, refer to 3.5.2 Closing Driveshields, page 44.
Removing Conditioner Drive Belt

**WARNING**

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the header fully.
2. Shut down the engine, and remove the key from the ignition.
3. Remove the left driveshield. For instructions, refer to 3.5.1 Opening Driveshields, page 42.
4. Turn jam nut (A) counterclockwise to unlock the tension adjustment.
5. Turn jam nut (A) and adjuster nut (B) counterclockwise to fully extend tensioner spring (C), and release the tension from conditioner drive belt (D).
6. Fully loosen hardware, then slide threaded rod (E) forward and down to disengage the rod pivot point from the disc speed sensor bracket.

**NOTE:**
The threaded rod pivot point must be disengaged from the disc speed sensor bracket to allow the tensioner assembly to rotate enough to remove the drive belt.

7. Remove drive belt (D).
Installing Conditioner Drive Belt

⚠️ WARNING
To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the header fully.

2. Shut down the engine, and remove the key from the ignition.

3. Open left driveshield (A). For instructions, refer to 3.5.1 Opening Driveshields, page 42.

4. Install drive belt (A) onto driven pulley (C) first, and then onto drive pulley (B), ensuring that the belt is in the pulley grooves.

   **NOTE:**
   If necessary, loosen the jam nut and adjuster nut to relieve the spring tension.

---

Figure 4.182: Left Driveshield

Figure 4.183: Conditioner Drive
5. Check position of the bracket, center-to-center distance (C) between drive pulley (D) and driven pulley (E) should be 723 mm (28 7/16 in.). If not, loosen M16 hex head bolt and lock nuts (A) on pulley mount bracket (B), and adjust the position of the bracket.

6. Torque hardware to 170 Nm (126 lbf·ft).

7. With hardware fully loosened, slide threaded rod (E) up and backward into the disc speed sensor bracket, then snug the hardware to engage the rod pivot point with the bracket.

8. Measure the length of tensioner spring (C). For proper belt tension, dimension (D) should be set to 17 mm (11/16 in.).

9. To adjust spring tension, loosen jam nut (A) by turning it counterclockwise.

10. Turn adjuster nut (B) clockwise to increase tensioner spring/belt tension or turn adjuster nut (B) counterclockwise to decrease tensioner spring/belt tension.

11. Once the correct spring measurement has been achieved, hold adjuster nut (B) in place and tighten jam nut (A) against it by turning the jam nut clockwise.

12. Reconnect speed sensor (B) to wiring harness (A).

13. Close the left driveshield. For instructions, refer to 3.5.2 Closing Driveshields, page 44.
4.11  Replacing Driveshields

If driveshields are missing, severely damaged, or are not securely installed due to damage, they must be replaced.

4.11.1  Removing Driveshields

⚠️ CAUTION

To reduce the risk of personal injury, do NOT operate the machine without the driveshields in place and secured.

NOTE:
Images shown in this procedure are for the left driveshield—the right driveshield is similar.

1.  Open the driveshields. For instructions, refer to 3.5.1  
   Opening Driveshields, page 42.

2.  Remove bolt (C), retainer pin (B), two washers (A), and a hex flange center lock nut from the top and bottom of the outboard half of the driveshield.

3.  Remove bolt (C), retainer pin (B), and the hex flange center lock nut from the front and rear of the inboard half of the driveshield.

   NOTE:
   The inboard half of the driveshield does NOT use washers (A).
4. Pull outboard side (A) and inboard side (B) of driveshield away from the disc header to remove.

4.11.2 Installing Driveshields

⚠️ CAUTION

Do NOT operate the machine without the driveshields in place and secured.

NOTE:

Images shown in this procedure are for the left driveshield—the right driveshield is similar.

1. Position outboard half (A) and inboard half (B) of driveshield as shown.
2. Secure the top of the outboard half of the driveshield with two washers (A), retaining pin (B), bolt (C), and a hex flange center lock nut.

3. Secure the front and rear of the inboard half of the driveshield with retaining pin (B), bolt (C), and a hex flange center lock nut.

**NOTE:**
The inboard half of the driveshield does **NOT** use washers (A).

4. Close the driveshields. For instructions, refer to **3.5.2 Closing Driveshields, page 44.**
4.12 Electrical System

4.12.1 Maintaining Electrical System

- Use electrical tape and cable ties as required to prevent the wiring harness from dragging or rubbing.
- Keep lights clean.
- Replace damaged lights.

4.12.2 Replacing Amber Hazard/Signal Light

⚠️ WARNING

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Shut down the engine, and remove the key from the ignition.
2. Detach harness (A) on light (B) from main header harness (C).
3. Loosen nut (D), and then remove light (B) from light bracket (E). Discard the light.
4. Loosen nut (D) on new light fixture (B), then insert the light into light bracket (E).
5. Tighten nut (D) to secure the light in place. Torque to 16 Nm (12 lbf-ft).
6. Connect light harness (A) to main header harness (C).
7. Check operation of the new light.

Figure 4.193: Left Amber Hazard/Signal Light
4.12.3 Replacing Header Disc Speed Sensor

If the header disc sensor malfunctions or is damaged, use this procedure to replace it.

⚠️ WARNING

To avoid bodily injury or death from unexpected startup of the machine, always stop the engine and remove the key from the ignition before leaving the operator’s seat for any reason.

1. Lower the header to the ground.
2. Stop the engine, and remove the key.
3. Open the left driveshield. For instructions, refer to 3.5.1 Opening Driveshields, page 42.
4. Disconnect wire harness (A) from speed sensor connector (B).
5. Remove fir tree clip and cable tie (E). Retain the clip for reinstallation.
6. Loosen nut (C) from the end of the sensor and remove the sensor from bracket (D).
7. Remove the nut from the end of the new sensor, install the new sensor into bracket (D) and secure with nut (C).
8. Connect sensor wire (B) to harness (A).
   **NOTE:**
   Ensure wires are clear of the belt and pulley.
9. Secure with fir tree clip (E) and the new cable tie.
10. Adjust nuts (A) as required to achieve a 2–3 mm (1/16–1/8 in.) gap (B) between sensor (C) and pulley (D). Ensure the sensor face and pulley face are parallel. Bend bracket (E) as required.
11. Tighten nuts (A) to 12 Nm (9 lbf-ft).
12. Close the left driveshield. For instructions, refer to 3.5.2 Closing Driveshields, page 44.
13. Start the windrower, engage the header, and check the operation of speed sensor on the monitor. The sensor may require re-calibrating. For instructions, refer to the windrower operator’s manual.
4.13 Hydraulics

4.13.1 Checking Hydraulic Hoses and Lines

Check hydraulic hoses and lines daily for signs of leaks.

⚠️ WARNING

- Avoid high-pressure fluids. Escaping fluid can penetrate the skin causing serious injury. Relieve pressure before disconnecting hydraulic lines. Tighten all connections before applying pressure. Keep hands and body away from pin holes and nozzles which eject fluids under high pressure.

- If any fluid is injected into the skin, it must be surgically removed within a few hours by a doctor familiar with this type of injury or gangrene may result.

• Use a piece of cardboard or paper to search for leaks.

IMPORTANT:
Keep hydraulic coupler tips and connectors clean. Allowing dust, dirt, water, or foreign material to enter the system is the major cause of hydraulic system damage. Do NOT attempt to service hydraulic systems in the field. Precision fits require a perfectly clean connection during overhaul.
Chapter 5: Options and Attachments

5.1 Cutterbar Deflectors – MD #B6847

A two-piece cutterbar deflector is attached to the cutterbar just below the header’s conditioner rolls. Deflectors provide improved feeding into the conditioner rolls and prevent heavy crop with long stems from feeding under the rolls.

Cutterbar deflectors may not be well-suited for some crop and field conditions. Refer to the following table:

Table 5.1 Conditions for Using Cutterbar Deflectors

<table>
<thead>
<tr>
<th>Crop/Field Condition</th>
<th>Use Deflector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average crop/normal field conditions</td>
<td>No</td>
</tr>
<tr>
<td>Long-stemmed and heavy/normal field conditions</td>
<td>Yes</td>
</tr>
<tr>
<td>Long-stemmed and heavy/sandy soil</td>
<td>No</td>
</tr>
<tr>
<td>Long-stemmed and heavy/gopher mounds or rocks</td>
<td>No</td>
</tr>
</tbody>
</table>

5. Removing the deflector helps feed dirt/rocks through the header and prevents debris build up, wear and damage from rocks.
5.2 Double Windrow Attachment – MD #C2070

This kit allows disc headers to lay a double windrow when installed on a windrower. The kit includes a draper deck, linkage assembly, hydraulics, and installation instructions.

MD #C2070 consists of:

- MD #B6693 – Deck
- MD #B6694 – Mounting frame and hydraulic/electrical connections
- Double Windrow Attachment (DWA) manual
5.3 Disc Feed Plate Kit – MD #B6669

The tall crop feed plates assist the feeding of tall crops into the conditioner by encouraging material flow from behind the cage deflectors. Do not use this kit in medium to light alfalfa as it will degrade the cutterbar’s cutting performance.

Figure 5.2: Disc Feed Plate Kit – MD #B6669
5.4 Electric Remote Baffle Kit – MD #B6664

The Electric Remote Baffle kit (MD #B6664), allows the operator to electronically adjust the disc header baffle from inside the windrower.

Figure 5.3: Electric Remote Baffle Kit
5.5  **Adjustable Gauge Roller Kit – MD #B6855**

The adjustable gauge roller kit allows the header to achieve the desired cutting height for optimum cutting performance. Adjustable gauge rollers are recommended only for dry and hard packed terrain.

![Adjustable Gauge Roller](image)

*Figure 5.4: Adjustable Gauge Roller*
5.6 Polyurethane Intermeshing Roller – MD #B6661

Rolls condition the crop by crimping and crushing the stem in several places, which allows the release of moisture resulting in faster drying times. A polyurethane roll conditioner is better suited for crushing stems while providing reduced crimping and is recommended for alfalfa, clover, legumes, and similar crops. The kit includes the conditioner and installation hardware.

Figure 5.5: Polyurethane Intermeshing Roller – MD #B6661
5.7 Steel Intermeshing Roller – MD #B6662

Rolls condition the crop by crimping and crushing the stem in several places, which allows the release of moisture resulting in faster drying times. Steel rolls with a larger gap (up to 25 mm [1 in.]) may be desirable for thick-stemmed cane-type crops; however, too large of a gap may cause feeding problems. Steel rolls are recommended for these types of situations. The kit includes the conditioner and installation hardware.

Figure 5.6: Steel Intermeshing Roller – MD #B6662
5.8 Adjustable Skid Shoes Kit – MD #B6848

The adjustable skid shoes kit allows the header to achieve the desired cutting height for optimum cutting performance. Skid shoes are recommended for most conditions including wet or muddy terrain.

Figure 5.7: Adjustable Skid Shoe – MD #B6848
5.9 Tall Crop Divider Kit – MD #B6808

Tall crop dividers attach to the ends of the disc header for clean crop division and cutterbar entry in tall crops. The kit includes left and right dividers and attachment hardware.

Figure 5.8: Tall Crop Divider – MD #B6808

</table>
Chapter 7: Reference

7.1 Torque Specifications

The following tables provide correct torque values for various bolts, cap screws, and hydraulic fittings.

- Tighten all bolts to torque values specified in charts (unless otherwise noted throughout this manual).
- Replace hardware with same strength and grade of bolt.
- Use torque value tables as a guide and periodically check tightness of bolts.
- Understand torque categories for bolts and cap screws by using their identifying head markings.

**Jam nuts**

When applying torque to finished jam nuts, multiply the torque applied to regular nuts by $f=0.65$.

**Self-tapping screws**

Standard torque is to be used (NOT to be used on critical or structurally important joints).

### 7.1.3 O-Ring Boss Hydraulic Fittings – Adjustable

1. Inspect O-ring (A) and seat (B) for dirt or obvious defects.
2. Back off lock nut (C) as far as possible. Ensure that washer (D) is loose and is pushed toward lock nut (C) as far as possible.
3. Check that O-ring (A) is **NOT** on threads and adjust if necessary.
4. Apply hydraulic system oil to O-ring (A).

5. Install fitting (B) into port until backup washer (D) and O-ring (A) contact part face (E).
6. Position angle fittings by unscrewing no more than one turn.
7. Turn lock nut (C) down to washer (D) and tighten to torque shown. Use two wrenches, one on fitting (B) and other on lock nut (C).
8. Check final condition of fitting.

<sup>6.</sup> Torque values shown are based on lubricated connections as in reassembly.
7.1.4 O-Ring Boss Hydraulic Fittings – Non-Adjustable

1. Inspect O-ring (A) and seat (B) for dirt or obvious defects.
2. Check that O-ring (A) is NOT on threads and adjust if necessary.
3. Apply hydraulic system oil to O-ring.
4. Install fitting (C) into port until fitting is hand-tight.
5. Torque fitting (C) according to values in Table 7.7, page 192.
6. Check final condition of fitting.

7.1.5 O-Ring Face Seal Hydraulic Fittings

1. Check components to ensure that sealing surfaces and fitting threads are free of burrs, nicks, scratches, or any foreign material.

2. Apply hydraulic system oil to O-ring (B).

3. Align tube or hose assembly so that flat face of sleeve (A) or (C) comes in full contact with O-ring (B).

4. Thread tube or hose nut (D) until hand-tight. The nut should turn freely until it is bottomed out.

5. Torque fittings according to values in Table 7.8, page 193.

   **NOTE:**
   If applicable, hold hex on fitting body (E) to prevent rotation of fitting body and hose when tightening fitting nut (D).

6. Use three wrenches when assembling unions or joining two hoses together.

7. Check final condition of fitting.

7.1.6  Tapered Pipe Thread Fittings

Assemble pipe fittings as follows:

1. Check components to ensure that fitting and port threads are free of burrs, nicks, scratches, or any form of contamination.

2. Apply pipe thread sealant (paste type) to external pipe threads.

3. Thread fitting into port until hand-tight.

4. Torque connector to appropriate torque angle. The turns from finger tight (TFFT) and flats from finger tight (FFFT) values are shown in Table 7.9, page 194. Make sure that tube end of a shaped connector (typically 45° or 90°) is aligned to receive incoming tube or hose assembly. Always finish alignment of fitting in tightening direction. Never back off (loosen) pipe threaded connectors to achieve alignment.

5. Clean all residue and any excess thread conditioner with appropriate cleaner.

6. Assess final condition of fitting. Pay special attention to possibility of cracks to port opening.

7. Mark final position of fitting. If a fitting leaks, disassemble fitting and check for damage.

NOTE:

Overtorque failure of fittings may not be evident until fittings are disassembled.

Recommended Lubricants

Keep your machine operating at top efficiency by using only clean lubricants and by ensuring the following:

- Use clean containers to handle all lubricants.
- Store lubricants in an area protected from dust, moisture, and other contaminants.

IMPORTANT:

Do NOT overfill the cutterbar when adding lubricant. Overfilling could result in overheating and failure of cutterbar components.
